Plaintiff sought to enjoin Trustees from selling submerged lands under FS 253.12 which had previously been conveyed erroneously to the plaintiff under the Murphy Act. The Murphy Act authorizes the state to sell land with delinquent property taxes in order to keep the land on the tax rolls. The state could not sell the land in question under the Murphy Act because it was submerged land which was not subject to a property tax. The Trustees of the Internal Improvement Fund were legally

LIBRARY U. OF I. URBANA - CHAMPAIGN

estopped by deed from denying the validity of the Murphy Act deed to submerged land, in absence of circumstances sufficient to prevent operation of legal estoppel against the state. (R. H. Watson-Fla)

95-1401 RIGHT OF WAY, DAMAGES FOR, 95-1402 GRANTS OF LAND, 95-1403 GRANTS FOR FERRY, 95-1404 VALUE OF LAND, HOW ESTIMATED.

95 Ga Code Ann Secs 1401-1404 (1967).

Descriptors: *Georgia, Eminent domain, *Grants, *Condemnation value, Condemnation, Bridges, State jurisdiction, Legislation, Land appraisal, *Right-of-way.

Sec 95-1401 provides that the damages for rights of way are to be assessed in the same manner as for public roads and private ways. Sec 95-1402 provides that grants of land on watercourses, with the appurtenances, convey no right to establish a public bridge or ferry. Sec 95-1403 provides that the grant of a ferry franchise conveys no right to build a bridge, or the converse. Sec 95-1404 provides that in determining the value of land taken for a bridge, its prospective value as a bridge site and its present value as a ferry, if one is in use, may be taken into account in determining compensation due. WISE MANAGEMENT OF NORTH CAROLINA WATER RESOURCES THROUGH LAW.
North Carolina Department of Natural Resources, Raleigh.

North Carolina Board of Water Resources Final Report, pp 1-53, April 1967. 54 p, 7 ref, 7 append.

Descriptors: *North Carolina, Federal government, *Legislation, Well permits, *Well regulations, Water conservation, Water control, Water demand, Water consumption, *Water resources, Water rights, *Watersheds (Basins), Water storage, Water table.

This report on the need for water legislation is the final report in response to directions issued by the 1965 General Assembly of North Carolina. The instructions given specified a study of the need for state regulation of water usage. This report is based on hearings held in each part of the state. The major Board finding is that a need for water use control exists in N C and a number of geographical areas face a significant potential need for early application of controls. The areas are then identified. The remedies proposed by the Board include legislation to provide: (1) A procedure to identify areas where water demands and problems require special action, a system to establish specially designed controls for these areas to include use permits, and provisions to assure due process; (2) A procedure for coordination of use of raw water supply sources so that maximum storage for public water supply may be included in federal projects; (3) A system of reporting water use; (4) Standards for well construction, abandonment, permits for large wells, etc; (5) Dam safety and coordination; (6) Educational program for flood plain management; (7) Minor changes to well driller registration; and (8) A state-wide well driller licensing law. (R. H. Watson-Fla)

FOCUS ON THE HUDSON.
Department of the Interior, Washington, D. C., Bureau of Outdoor Recreation.

In Bureau of Outdoor Recreation, Government Printing Office, Washington, D. C., 1966, 50 p, 65 photo, 1 map, 6 ref.

Descriptors: *Water resource management, Recreation, Project planning, Federal project policy, Political aspects, *Outdoor recreation, National historic sites, Federal jurisdiction, Social needs, Jurisdiction, Scenic easements, Interagency cooperation, River basin development, Local governments, Highway beautification, Fish conservation.
Identifiers: Hudson River, Lower Hudson Waterfront, Hudson Highlands National Scenic Riverway.

The main emphasis of the report is on the development and maintenance of the recreational value of the Hudson. Basic issues of water pollution, inadequate public access to the river, uncoordinated approaches to planning, and conflicting land usage are discussed in light of their effects on the recreational environment. It is recommended that the States of New York and New Jersey amend legislation, to permit State Zoning review and control over local municipalities along the river, and amend taxing policies to encourage use of conservation easements and land use tools for preservation of historic sites. A land acquisition program is proposed to develop and revitalize the waterfront, which has fallen into disuse in many areas. Possible programs for the protection and development of fish and wildlife are presented. Industrial, commercial, residential, and institutional land uses should be fitted into an overall plan for preserving and protecting the scenic and recreational values of the Hudson. To this end a Federal-Interstate Compact is recommended. The scope of its responsibilities, jurisdiction, and authority is defined. (Gargola-Chicago)

WATER RESOURCES MANAGEMENT IN MARYLAND.
Maryland Department of Water Resources, Annapolis.

The Water Resources Study Committee, University of Maryland, 1967, 87 p, 6 photo, 3 tab, 1 fig, 75 ref.

Descriptors: *Water policy, *Water resources management, *State governments, Water supply, Water rights, Water law, Appropriation, Project planning, Regional analysis, Future planning, Coordination, *Adoption of practices, Decision making, Administrative agencies, Flood plain zoning, Long-term planning, Water resources development.
Identifiers: Maryland.

Initially given is a brief summary of nineteen recommendations for overall water resources development in Maryland. Particular opportunities and problems are discussed. Water rights and regulations are reviewed and limitations of existing laws are pointed out. What is needed to facilitate solution of these problems and inadequacies is an overall water resources program for the entire state. For the development of an overall program the relationship between available resources and projected alternative uses must be defined. To this end, eleven suggestions are made to define the responsibilities of the Department of Water Resources: (1) overall planning, (2) data collection, (3) water quality surveillance, (4) sedimentation control, (5) information and education, (6) appropriation of dam and reservoir permits, (7) revision and review of laws, (8) efficiency of sanitary service in metropolitan areas, (9) participation in interstate water resources development, (10) state coordination of federal assistance, and (11) research in water development problems. ORGANIZATION FOR COMPREHENSIVE RIVER BASIN PLANNING: THE TEXAS AND SOUTHEAST EXPERIENCES,
Michigan Univ., Institute of Public Administration.
Robert H. Pealy.
University of Michigan, Ann Arbor, 1964, 164 p, 12 tab, 36 ref.

Descriptors: Project planning, *Adoption of practices, Evaluation, *River basin planning, *Decision making, Political aspects, Institutional constraints, Municipal water, Non-structural alternatives, Coordination, Administrative agencies, Water management, Adoption of practices, Multiple purpose projects, Project planning, Attitudes, River basin commissions.
Identifiers: U. S. Study Commission (Texas), U. S. Study Commission (Southeast River Basins).

Through a study of two experiences in comprehensive river basin development, it is hoped that new insights can be gained concerning the nature of planning and the organizations which do it. Assessments of both the Texas and Southeast River Basin Planning Commission is done through investigation of the constraints and influences which limited or prescribed their activities. Past traditions of planning and the legal framework in both instances are reviewed. The background and attitudes of Chairmen, Commissioners, and staff members who were responsible for major decisions was studied. Specialities of the staff and the number of workers through time is studied in relation to effects on the decision-making process. Comparison is made between the two agencies, and it is shown what major decisions affected the final plans, the process by which they were made, and why. For each commission the physical, economic, and political background is studied. The policy procedures and organization for operations is analyzed. In conclusion, the Texas Commission emerges as more an agency coordinating device while the Southeast Commission performs the more intended function of a planning organization. (Gargola-Chicago)

RIVERS AND REGIONALISM IN NEW ENGLAND,
Massachusetts Univ, Amherst. Bureau of Government Research.
Edwin Andrus Gere.
Booklet, University of Massachusetts, 1968, 71 p, 1 map, 87 ref.

Descriptors: Water resource development, Federal project policy, Project purposes, Project planning, *Federal jurisdiction, State jurisdiction, Federal government, Political aspects, Local governments, River basin planning, State governments, *Administrative agencies, Decision making, *River basin commissions, Interagency cooperation, Institutional constraints.
Identifiers: New England Interstate Water Pollution Control Compact, New England-New York Interagency Committee, Northeastern Resource Committee, New England Regional Planning Commission, New England.

Contrary to the allegation that the federal government is crushing state powers, this study theorizes that the federal government is actually strengthening state governments by openly encouraging the process of regional interstate cooperation. To test this theory, the study proceeded with a historical and developmental examination of federal activity in flood control, water pollution control, and water resource management. The nature of federal participation in regional cooperation for solution of these problems is shown to be strong, persistent and many-faceted. Basic formal mechanisms discussed are interstate compacts and direct congressional statutes, from which additional mechanisms are generated. The most appropriate description of the emerging federal role in regional planning, is that it is facilitating and enhancing state cooperation. These conclusions are derived from a study only of the New England region, and are limited to federal activity for the region. (Gargola-Chicago)

WATER POLLUTION CONTROL IN WASHINGTON,
Washington Univ., Seattle, Ctr. for Urban and Regional Research.
L. A. Powe.

Reprinted separately as Univ. of Washington Reprint 13. Washington Law Review, Vol. 43, 1967, p 425-454, 1 append, 190 ref.

Descriptors: Water Pollution Control Act, Legal aspect, Pollution abatement, State governments, Federal governments, Jurisdiction, Water law, *Water pollution sources, Water pollution control, Water permits, *Paper pulp wastes, Pulp and paper industry, Regulation, Political constraints.
Identifiers: Puget Sound (Washington).

Reported are the Washington Pollution Control Commission's attempts to secure improved water quality in the Puget Sound area. Since the pulp industry is the major polluter of the region, the emphasis of the report is on attempts to control this industry. A history of the Commission's past efforts to control pollution through legal methods is reviewed. The permit system, enacted in 1955, is discussed in relation to the legal difficulties it encountered from the pulp companies. It was contended that the attempts to control their waste discharges represented a violation of their rights. Cases which relate to the validity of the Water Pollution Control Act, and its constitutionality are reviewed. Although it seemed by precedent that these allegations were unfounded, legal problems developed. Because of the difficulties encountered there has been little enforcement action since 1962. Certain legal developments in Federal and State law have strengthened the Water Pollution Control Act, which gives promise to the future. (Gargola-Chicago)

SUMMARY REPORT ON TITLE TO BEDS AND USE OF NAVIGABLE STREAMS AND LAKES IN IDAHO,
Idaho Univ., Moscow, College of Law.
Thomas R. Walenta.
Water Resour Res Inst Rep, Dec 1966. 35 p. OWRR Project A-010-Ida.

Descriptors: *Water policy, Navigable rivers, Water zoning, *Water law, Water levels, Lakes, *High-water mark, *Riparian rights, Lake beds, Lake shores, Streambeds, Legislation.

Federal and State laws and statutes governing the ownership and control in Idaho of the beds of navigable streams were studied together with their waters. State title to beds was rejected in 1908 by the Idaho Supreme Court in Johnson vs. Johnson; 14 Idaho 561; then in 1915 this was reversed by another court action. Navigability of streams and lakes was studied and laws explained as pertaining to use of the beds of those streams and lakes. Indian treaties and rights were also studied as related to ownership of the beds of streams. Proposed legislative changes and recommendations were pointed out. A discussion is also presented on the legislative role in the development of water resources of Idaho. (Warnick-Idaho Univ)

THE MUNICIPALITY AS A WATER-POLICY DETERMINING ENTITY,
California Univ., Los Angeles, Pol Sc Dept.
Winston W. Crouch.
Water Resour Center, Tech Completion Rep, Jan 1968. 4 p. OWRR Project A-014-Cal.

Descriptors: Water rights, *Municipal water, Water delivery, Water management, Water resources, Water sources, *Policy matters, Ground water, *Water policy, Water management (Applied), Water districts, Water development.

The objective was to examine the role of municipalities as water-policy determining entities in 4 southern California counties having a metropolitan-wide district organized to import water, supplementing local sources. Seven cities were studied with differing history in water development and service. Metropolitan-wide districts decided to not admit individual cities but rather large blocks of land which included groups of cities and unincorporated territory. The question was the effect of this decision on the municipalities role as water distributors. Of cities organized before the 1930 decision, 80% have municipal water systems; only 18% incorporated after 1930 have municipal systems. The balance are served by private water enterprises, county water districts and other types of suppliers. The second question concerned whether the policies of those cities with municipal systems were developed as political or administrative processes. Very striking differences were found between cities, depending upon background policy and character of policy.

STRATEGY AND ORGANIZATION IN PUBLIC LAND POLICY,
RAND Corp., Santa Monica, Calif.
George R. Hall.
Natural Resources Journal, Vol 7, No 2, pp 162-182, April 1967.

Descriptors: *Public lands, *Natural resources, *Federal Project policy, *Land management, Administration, Constraints, Geographical regions.
Identifiers: Public Land Law Review Commission, *Externalities, Exclusionary uses, Heterogeneity of land holdings, *Goods.

Significant managerial and policy improvements in the natural resources sector will require a significant reorganization of federal departments and agencies. This paper considers the strategic objectives of public land and management and the factors that make achieving these objectives a complex and difficult task. Four complicating factors are examined: externalities, exclusionary land use, heterogeneity of public land holdings and divided governmental responsibility. The last is identified as the most important barrier in the way of achieving major improvements in public policy towards natural resources. Two reforms are needed. The first is an end-use approach to policy formulation. The second and related reform is a reorganization of the administration of the federal government's natural resource responsibilities. WATER AND RELATED LAND RESOURCES LAW AND POLITICAL INSTITUTIONS.
Cornell Univ, Ithaca, N Y.
William H. Farnham.
Tech Rep 8, Water Resour Center, Nov 1967. 55 p, 95 ref. OWRR Project A-003-NY.

Descriptors: Boundaries (Property), *Riparian rights, Properties, Legal aspects, Administration, *Water law, *Water rights, *New York, Legislation, Administrative decisions, State government.

One function of social science research is to provide an understanding of social processes and justifications to allow their modification, improvement, and adjustment to new conditions. This project is one more step in modernizing the water law of the east, particularly New York state's version of Riparian Doctrine. Each step is conditioned by an overall strategy to remove uncertainty in the law without undue loss of flexibility. Further, strategy rejects as either feasible, desirable, or politically possible any major shift in water law doctrine. Instead it accepts the notion that through a review of carefully studied, well understood steps, a sounder foundation for the future can be built. Two significant changes in statute law have been proposed. The first clarified the law with respect to the legality of alterations in the natural condition of water courses and lakes which cause no harm to others, declaring them lawful and avoiding the necessity for suit by others to protect their rights until actually harmed. The second suggests that harmful alterations be lawful if reasonable and provides some guidelines for reasonableness. These changes, when adopted, will provide a clear base from which further changes can be made.

FIRST ANNUAL SOUTH CAROLINA GOVERNOR'S CONFERENCE ON WATER RESOURCES.
Clemson Univ., South Carolina.

Water Resour Res Inst, Mar 1967. 85 p, 1 tab. OWRR Project A-999-SC.

Descriptors: *Water resources, *Water resources development, Water quality, Water pollution, Waste treatment, Water law, Planning, Water management (Applied), Water Resources Research Act, *South Carolina, Responsibilities, Water pollution control, Hydroelectric power, Long-term planning, Conferences, Water utilization.
Identifiers: Water plans, Water use.

The First Annual South Carolina Governor's Conference on Water Resources held March 1 and 2, 1967, at Columbia, South Carolina, was for the primary purpose of: (1) exploring the current water situation in South Carolina and its relation to the national picture; (2) establishing the State's responsibilities in all aspects of Federal-State cooperation in water resources; and (3) considering programs in water resources planning and development for South Carolina. Ten papers relative to these 3 catagories were presented and are published in the Conference proceedings.

6F. Nonstructural Alternatives

FLOOD CONTROL VIA THE POLICE POWER,
Allison Dunham.
U Pa L Rev, Vol 107, No 8, pp 1098-1132, June 1959. 35 p, 128 ref.

Descriptors: *Flood plain zoning, Regulation, *Flood protection, Flood control, State governments, Flood plain insurance, Land use, *Flood damage, Federal government, Federal-state water rights conflicts, Legislation, Legal aspects, Project purposes, Dams, Building codes, Economic justification, Risks, Government finance.

Despite extensive study and agitation concerning water resources, public expenditure on water problems, and federal-state relations involving water, very little change in policy has occurred in the past ten years. It is the purpose of this paper to examine briefly the history of the movement toward regulation of land use in the flood plain; to suggest a conceptual framework by which the consequences of such regulation may be judged; to analyze the reasons advanced for this restriction on individual decisions concerning use of private land; and, finally, to consider the constitutional basis of this proposed use of the state's police powers. Throughout this paper the term flood plain zoning is used to cover all of the types of regulation which can be used to regulate land use for the purpose of affecting flood losses. (R. Smith-Fla)

LIBRARY U. OF I. URBANA - CHAMPAIGN

A STUDY TO DETERMINE THE STATE AND COMMUNITY RESPONSIBILITIES INHERENT IN FLOOD DAMAGE PREVENTION PLANNING IN URBAN DEVELOPMENT,
Maybelle C. Fox.
Unpublished Master's Thesis, Univ. of Miss., Department of Urban and Regional Planning, University, June 1969, 87 p, 1 append, 53 ref.

Descriptors: Urbanization, Community development, *Flood control, Multiple-purpose projects, *Non-structural alternatives, Land-use, *Flood plain zoning, Pychological aspects, Government supports, Inter-agency cooperation, Dams, Reservoirs, Channel improvements, Flood forecasting, Research and development.
Identifiers: Flood plain management, Citizen participation, University of Mississippi, Public education.

The purpose of this thesis is to determine the State and community responsibilities inherent in a successful flood damage prevention planning program. The need for flood control by preventive planning in addition to corrective measures was determined as a result of investigations conducted during the study. The major types and methods of flood control were identified, together with an analysis of their use. On the basis of the identification of these methods, the various levels of government can develop a suitable program of flood damage prevention. The importance of intergovernmental coordination and responsibility in plan formulation and implementation was stressed. Cited are examples of laws, ordinances, and regulations that have been used in flood plain management. Recommendations made are: (1) studies to determine the potential flood hazard; (2) structural methods of flood control alone are not adequate protection from flooding; (3) local citizen acceptance and participation in the program; (4) analysis of corrective and preventive measures for each locality; and, (5) where necessary, the local government should seek assistance from the State and Federal governments. (Gargola-Chicago)

AN ECONOMIC APPROACH TO COPING WITH FLOOD DAMAGE,
Resource for the Future, Inc., Washington, D. C.
John V. Krutilla.
Water Resources Research, Vol 2, No 2, pp 183-190, Second Quarter 1966. 2 ref.

Descriptors: *Flood damage, *Flood plain insurance, *Flood protection, Insurance, Efficiencies, Flood plains, Flood control, Cost sharing, Benefits, Costs.
Identifiers: *Insurance premiums, Public good, Residual damage potential, Compulsory flood insurance, Social cost, Private cost.

A compulsory flood loss insurance scheme is one means of achieving efficient uses of flood plain lands. Insurance premiums proportional to risk and equal to both the private and the social cost of flood plain occupance will serve as a rationing device, eliminating economically unwarranted uses of flood plain lands on the one hand, while not prohibiting uses for which a flood plain location has merit. In addition, reduction of flood loss insurance premiums can serve as a standard to measure economic justification of alternative flood control measures and/or discrete increments in the scale of protective works or other nonstructural flood control measures. A final advantage of flood loss insurance, which no alternative of flood management possesses, is indemnification for the residual damage potential against which it is not economic to seek protection. 6G. Ecologic Impact of Water Development

AN INVENTORY AND STUDY OF BEAVER IMPOUNDED WATER IN MISSISSIPPI,
Mississippi State Univ., State College.
Dale H. Arner, James Baker, and David Wesley.
Water Resour Res Inst Rep, July 1966. 26 p, 8 fig, 10 tab, 6 ref. OWRR Project A-009-Miss.

Descriptors: *Beavers, *Pond, *Waterfowl, Aquatic life, Ducks (Wild), Weed control, Invertebrates, Wildlife, Wildlife management, Conservation, *Impoundments, Mississippi.

A cooperative program was inaugurated with Federal and state conservation agencies to inventory beaver ponds and acreage contained in these impoundments in the state of Mississippi. Cooperating agencies reports revealed a total of 956 beaver ponds of 1 acre and over and a total of 23,673 acres flooded by beaver ponds. Research workers checked 10% of the ponds to determine accuracy of acreage estimates made by cooperating agencies and to determine acreage suitable for developing into waterfowl feeding areas. This revealed a statistically significant correlation between estimates made by cooperating agencies and measurements made by investigators. In the beaver ponds studies, 58.1% contained areas which could be planted to duck millet. It was estimated that with emergent weed control 56.5% of the total acreage of these ponds could be developed into duck feeding areas. In the Loess area invertebrates taken by all 3 techniques were in significantly greater abundance in beaver ponds than in upstream sites. In Upper Coastal Plains soils area, the weight or volume of captured invertebrates was greater in beaver ponds than in upstream sites, but was significantly greater only using the net sweeping technique.

CITY OF ATLANTA V WILLIAMS (SURFACE DRAINAGE).
218 Ga 379; 128 S E 2d 41-43 (1962).

Descriptors: *Drainage, *Ditches, Surface waters, Easements, *Overflow, Riparian rights, Drainage water, Water law, Legal aspects.

The plaintiff sought to enjoin the city from using its drainage ditch near his property in such a manner that surface waters overflowed onto his property. The court held that the city had, by a use of the ditch for 20 years, acquired an easement by prescription but there had been no continuous overflow of water from the ditch and the city did not have an easement to overflow the ditch. The city was under a duty to maintain the ditch so that the content and flow of surface waters would not overflow. (Horner-Fla)

P. S. Eagleson.
Water Resources Res, Vol 3, No 4, pp 1021-1033, 1967. 13 p, 10 fig, 12 ref.

Descriptors: *Statistical methods, *Network design, *Climatic data, *Rainfall, Rainfall disposition, Fourier analysis, Linear programming, Hydrography, Distribution patterns.
Identifiers: Network density.

Techniques of harmonic analysis and the concepts of distributed linear systems are used to study the sensitivity of peak catchment discharge to the characteristic spatial variability of convective and cyclonic storm rainfall. Application of the sampling theorem leads to quantitative general relations for optimum rainfall network density for the study of long-term, catchment-average rainfall is accomplished by considering the long-term point rainfall as a homogeneous random variable to be sampled spatially. Incorporation of catchment dynamics into the design of flood forecasting networks reduces the number of gages needed when compared with that obtained solely through consideration of precipitation variability. In many studies little advantage is gained by utilizing more than 2 properly located stations for the determination of long-term areal mean rainfall. (Author)

THE CONTINUOUS PLANKTON RECORDER-A REVIEW OF THE LITERATURE,
Minnesota Univ., Minneapolis.
Theodore A. Olson, Theron O. Odlaug, and Wayland R. Swain.
Water Resour Res Center Bull 3, June 1966. 221 p 92 fig, 6 plate, 21 tab, 40 ref. OWRR Project A 011-Minn.

Descriptors: Deep water, Limnology, Atlanti Ocean, Eddies, Ocean currents, Indicators, Or ganic matter, Aquatic environment, Zooplanton Aquatic life, Aquatic populations, Biology Eutrophication, Lakes, *Productivity, Trophi level, *Plankton, *Research equipment, Biomass Plytoplankton.

The literature concerning the Continuous Plankto Recorder (CPR) is reviewed in this report. Th Hardy Recorder can be towed behind a comme cial vessel proceeding at normal speed. Organism of the plankton assemblage are swept into th mouth of the sampler and then are carried back t a point where a slowly moving bolting cloth ban crosses the water tunnel. The band, which forms complete barrier at this point and is supported the back by a coarse grid, strains out the organism Later, in the laboratory, the bands can be unrolle on a special stage and examined under microscope. Since the towing path and speed a known and the rate of tape advance within the sam pler is also known, specific portions of the boltin cloth surface can be associated with definite lak areas and a mile-by-mile estimation of the n plankton distribution is possible. The use of th recorder has been limited almost entirely to th marine environment but the same technique shou be readily applicable to studies of the organism comprising the second trophic leval in fresh water

A PROPOSAL TO STUDY HYDROLOGICAL DATA ACQUISITION THROUGH REMOTE RECONNAISSANCE SYSTEMS,
Montana Univ., Missoula.
Fred L. Gerlach.
Water Resour Res Center Rept, 1966. 10 p, 7 fig, 2 ref. OWRR Project B-002-Mont.

Descriptors: *Hydrologic data, Data collections, Hydrology, Surfaces, Moisture content, *Remote sensing, *Infrared radiation, *Soil moisture, Thermal radiation, Aerial photography.
Identifiers: *Infrared imagery, Infrared scanning, Aerial reconnaissance.

Areas considered by the pilot study of 1965-66 were: (1) characteristic surface temperature and surface radiation differences of selected terrain features (those having surface moisture differences). (2) Characteristic tonal contrasts on aerial infrared scanned imagery with proper consideration for other identifying characteristics in the interpretation of this imagery produced by temperature and radiation differences between features. (3) Increased probability for correct interpretation by increasing differences registered in the imagery through selection of optimum conditions or time for collecting the imagery. It is apparent from data that the time of day relative to the amount of insolation receipt is highly important. Also, weather conditions existing prior to and during the data collection characteristics of surface moisture conditions. Other work included: (1) laboratory tests of surface temperature; (2) airborne radiometric surface temperature measurements; and (3) the establishment of a series of plots for airborne radiometric temperature measurement. The objectives of this study have been partially reached. Continued study is necessary to provide a base for a broader and more intensive application of remote reconnaissance methods to water resources management and research.

RESPONSE OF FLOAT TYPE STAGE RECORDER SYSTEMS,
Purdue University, Lafayette, Indiana.
J. W. Delleur, and D. Blank.
Purdue Univ Eng Reprints CE 241, pp 165-172, Feb 1968. 8 p, 5 fig, OWRR Project A-001-Ind.

Descriptors: *Instrumentation, *Research and development, *Water levels, *Floats, *Gages, Stream gages, Depth.
Identifiers: *Stage recorders.

To aid in evaluating performance of hydrologic systems by measuring water yield, the frequency response and phase distortion of the measuring equipment were studied. A float type stage recorder was installed above an oscillating tank used for generating the water level fluctuations. The tank can be subjected to a vertical harmonic motion with amplitudes ranging from 4 to 10 in. and frequencies 2 to 15 cycles per minute. The dynamic equations of motion of the float are developed with and without taking into account the influence of the friction forces. The motion of the water surface as recorded by a sonic transducer was compared with the motion of the float as obtained from the stage recorder. The results indicate that the float follows the motion of the surface of the water very closely, and that, within the amplitude and frequency range tested, there is no significant signal deformation. ATOMIC FLUORESCENCE FLAME SPECTROMETRY,
New Hampshire University, Durham.
David W. Ellis, and Donald R. Demers.
Advances in Chem Ser, No 73, pp 326-336, 1968. 11 p, 4 fig, 3 tab, 22 ref. OWRR Project A-003-NH.

Descriptors: *Chemical analysis, *Flame photometry, *Fluorometry, Inorganic compounds, Instrumentation, Water analysis.
Identifiers: Atomic fluorescence flame spectrometry.

The use of atomic fluorescence flame spectrometry in the analysis of trace inorganics is reviewed and evaluated. The method is competitive with and often superior to atomic absorption and flame emission methods. Its advantages are that intensity of response may be controlled, light source emission profile may be wider than the absorption profile of the sample, the response signal is added to background and may be electronically amplified, and calibration curves are linear over a wide sample concentration range. With a line source, the method is more sensitive than other flame methods. With a continuous source, both qualitative and quantitative analyses may be made simultaneously. (Knapp-USGS)

INSTRUMENTATION FOR SEISMIC EXPLORATION FOR GROUND WATER IN HAWAII,
Hawaii Univ., Honolulu.
Leonard A. Palmer.
Tech Rep 7, Water Resour Res Center, Apr 1967. 26 p, 12 fig, 5 ref. OWRR Project A-009-Hi.

Descriptors: *Instrumentation, *Groundwater, *Exploration, Seismic studies, Seismology, Explosions, *Hawaii, Water table.

This study developed instrumentation and techniques to be used for seismic exploration of ground water in Hawaii. A 3-stage field test of instruments and methods was conducted to determine capability of recording and reproducing seismic data. Reproducibility was the main criterion to permit using certain signal analysis techniques. Multi-channel explosive tests utilizing dynamite shots were carried out in Waimanalo, Oahu during first stage of testing. The second stage used a 2-channel magnetic tape recorder converted to receive voice and uphold geophone signals on 1 channel and seismic signals on the other channel. Stage 3 tested the use of a 'thumper' acoustical source, seismic filters, and timers developed for the project. Signals generated by explosives and recorded photographically were very reproducible, but this is relatively expensive and analysis is slow. Seismic data recorded on magnetic tape allows versatility in analysis of recorded signals reproduced either in wiggle or intensity contrast analog form. Sections can be selected for digital computer analysis. The findings from this pilot phase do not indicate that seismology would not be an appropriate tool for studying geological structure.

REMOTE SENSING OF HAWAIIAN COASTAL SPRINGS USING MULTISPECTRAL AND INFRARED TECHNIQUES,
Hawaii Univ., Manoa.
Larry K. Lepley, and Leonard A. Palmer.
Tech Rep 18, Water Resour Res Center, Aug 1967. 39 p, 16 fig, 3 tab, 31 ref. OWRR Project B-005-Hi.

Descriptors: *Remote sensing, Water resources, Aerial photography, Temperature, Thermometers, *Springs, Synoptic analysis, Photography, Spectophotometry, Color, Hydrology, Sea water, Fresh water, Coasts.
Identifiers: Radiometers, Infrared imagery, Infrared spectroscopy.

Two remote sensing techniques for measuring offshore ground-water spring discharge have been studied: (1) multispectral photography, and (2) infrared thermometry. During the summer of 1967, exposure factors for filter-film-camera combinations extending outside the visible spectra were experimentally determined and tabulated. One spectral series of simulated aerial photography was obtained. Darkroom procedures and equipment for multispectral enhancement of the suspected color differences between sea water and offshore spring water in these photographs have not yet been precisely defined. Helicopter flights with an infrared thermometer have demonstrated that offshore springs can be identified by their temperatures. Due to the irregular shape, size, and location of these fresh water outflows, a synoptic technique is needed. An infrared scanner is desirable but the present costs are prohibitive.
W69-00982

SOME SEISMIC TECHNIQUES FOR MAPPING SMALL SCALE SHALLOW STRUCTURES,
Hawaii Univ., Manoa.
Cornelius Joziasse, and William M. Adams.
Tech Rep 11, Water Resour Res Center, Aug 1967. 15 p, 10 fig, 4 ref. OWRR Project B-005-Hi.

Descriptors: Hawaii, Microwaves, Seismic waves, Seismic studies, Vibrations, Mapping, Geologic mapping, Surveys, Geophysics, *Seismic investigations, *Seismographs, Subsurface investigations, Exploration, Instrumentation.
Identifiers: Reflectivity, Seismic tests, Oahu, Hawaii, Seismic refraction, Seismic reflection.

Seismic recording and playback techniques and equipment are being developed for use in mapping small-scale geologic structures of significance in controlling movement of ground water. High-frequency seismic waves produced by weight-dropping, or thumping, are used to provide the necessary resolution to detect these small structures. A vibrator has been constructed as another source of high frequency seismic energy. A DC motor is the transducer with storage batteries providing the power. A 4-channel tape recorder is used to obtain seismic records on a 10-ft spacing. This spacing gives good correlation from record to record. A storage oscilloscope gives visual displays of seismic data as wiggly line playbacks which are stored on the screen and then photographed. Also being used is variable intensity playback of reflection records. This allows signal averaging to be done optically and gives an easily interpreted display. A seismic survey done in the Waimanalo area on Oahu, Hawaii indicates that the thumper can produce sufficient amounts of high frequency energy to permit shallow reflection prospecting.

SEDIMENT SAMPLING: INSTRUMENTATION AND TECHNIQUES,
Dept. of Agriculture, Oxford, Miss., Sedimentation Laboratory.
C. R. Miller, and A. J. Bowie.
Trans. Amer Soc Agr Eng, Vol 8, No 2, pp 267-270,274, 1965.

Descriptors: *Bed load, Sediment load, *Sediment transport, *Sediment discharge, *Sampling, *Instrumentation, Arid lands, Data collections, Measurement, Streams, Technology, Research and development, Mechanical equipment.

The various instruments and techniques currently employed by the U.S.D.A. Sedimentation Laboratory to sample sediment discharge were described. Major problems associated with accurate determination of total sediment movement and measurement of sediment discharge on rapid rising streams and at remote locations were discussed. A variety

LIBRARY U. OF I. URBANA - CHAMPAIGN

of methods to improve and automate sediment sampling that are under investigation by the Federal Inter-Agency Sedimentation Project were described. Continuing research will provide guides and methods for combining field sediment-sampling results with stream hydraulics and sediment characteristics in the development of methodology for determining total sediment discharge that occurs in streams that are located in the arid parts of the world. ON THE COMPARISON OF PRECIPITATION GAUGES,
India Meteorological Office, Poona.
V. Kalyanasundaram.
Indian J Meteorol Geophys, Vol 17, No 4, pp 627-632, October 1966. 6 p, 3 fig, 3 tab.

Descriptors: *Precipitation gages, *Arid climates, Measurement, *Reliability, *Rain gages, Instrumentation, Data collections, Variability.
Identifiers: *Comparisons, India.

Reliability of rainfall measurements made in India were assessed using comparisons between raingauges in routine use in the national network and raingauges adopted by W.M.O. as International Reference Precipitation Gauges (IRPG). Differences between the 24-hour rainfalls recorded by two I.M.D. gauges varied between 0.4 and 1% while differences between two IRPG's were smaller and insignificant. All differences were insignificant above a daily rainfall of 25mm. Descriptions of the various raingauges and details of their installation were given. In order to determine and compare hydrologic factors that occur on different arid watersheds of the world, raingauges used in these areas must be correlated in order to receive valid information from these different localities. IMPROVEMENT AND TEST OF AN INSTRUMENT FOR RECORDING COARSE SEDIMENTS,
N. Ya. Solov'yev.
Soviet Hydrol: Selec Pap, No 2, pp 158-172, 1967. 15 p, 9 fig, 2 tab, 6 ref. Translation from Trudy GGI, No 141, pp 58-78, 1967.

Descriptors: *Instrumentation, *Sediment discharge, *Saltation, Streams, Flumes.
Identifiers: USSR, Coarse sediment sensor.

An instrument for detecting coarse sediment particles moving above stream beds is described. The principle of operation is the impact of particles on a plate connected to the moving part of an induction transducer. The signal produced is proportional to the product of mass and velocity of the particle. Because the instrument changes the pattern of flow locally so that particle velocity on impact with the receiving plate is not the same as in the undisturbed stream calibration experiments were made in a flume in a mountain stream. Data from the sensor are recorded by a five channel pulse height analyzer. Field tests show that the response of the sensor to fluctuating sediment discharge is more accurate than the results of standard determinations by sampling. (Knapp-USGS)

A SENSOR FOR WATER FLUX IN SOIL. 'POINT SOURCE' INSTRUMENT,
Commonwealth Scientific and Industrial Research Organization. Div. of Land Research, Canberra (Australia).
G. F. Byrne, J. E. Drummond, and C. W. Rose.
Water Resources Res, Vol 3, No 4, pp 1073-1078, 1967. 6 p, 2 fig, 10 ref.

Descriptors: *Groundwater movement, *Instrumentation, *On-site tests, *Current meters, *Flowmeters, Calibrations, Research and development.
Identifiers: Soil water flux meters.

The theoretical analysis and laboratory calibration of a sensor to measure fluid in soil or other porous medium shows that a flow velocity of .0001 cm per sec can be readily measured, and that output is uniquily related to flux. The flow to be measured causes asymmetry in the temperature field generated by an approximation to a point source of heat located centrally in the instrument. The temperature difference due to this asymmetry gives rise to the output of the instrument. The instrument was tested and calibrated in a saturated clay loam. The sensitivity is such that there is some promise that the instrument may be of utility in flux measurement in unsaturated as well as saturated media. (Author)

AUTOMATIC PROCESSING OF OPERATIONAL HYDROLOGIC INFORMATION,
Hydrometeorological Sciences Research Center, USSR.
Ye. P. Chemerenko.
Soviet Hydrol: Selec Pap, No 2, pp 189-194, 1967. 6 p, 1 fig. Translation from Trudy GMTs No 2, pp 59-66, 1967.

Descriptors: *Data processing, *Computers, Data transmission, Networks, Telemetry, Statistical methods, Numerical analysis.
Identifiers: USSR, Hydrological data network, Automatic data handling.

Some problems associated with automation of the processing of hydrologic information received at the USSR Hydrometeorological Scientific Research Center are examined. Variants of programs for recoding, storing, and searching and preparing the needed parameters for computation are described. At present practically all hydrologic information is processed by hand. Numerical methods of forecasting are nearly never used in operational work. Most of the forecasting methods are based on the use of relatively simple empirical relationships which have insufficient reliability and accuracy, so an important role is played by the experience and intuition of the forecaster. Furthermore, at present the data input is too small for automatic processing of hydrologic data alone to be economically feasible. However, meteorological data are handled automatically and are the major part of the work at the hydrometeorological center. Hydrological data can be included at very little additional cost when appropriate methods of analysis are developed. Current studies in the use of computers in handling hydrologic data include multidimensional statistical analysis and numerical methods for solving differential equations. (Knapp-USGS)

A METHOD OF DETERMINING THE PERMEABILITY AND EFFECTIVE POROSITY OF UNCONFINED ANISOTROPIC AQUIFERS,
Technion Israel Institute of Technology, Haifa.
G. Dagan.
Water Resources Res, Vol 3, No 4, pp 1059-1071, 1967. 13 p, 8 fig, 1 tab, 16 ref.

Descriptors: *Groundwater movement, *Drawdown, *Unsteady flow, *Aquifer characteristics, *Anisotropy, Thesis equation, Permeability, Porosity, Transmissivity.
Identifiers: Anisotropic aquifers.

The equations of unsteady flow toward a partially penetrating well in an unconfined aquifer of finite thickness are solved by linearization. It is assumed that the aquifer is nondeformable and the effective porosity at the water table is constant. It is also assumed that the aquifer is anisotropic (the principal axes of the permeability tensor being horizontal and vertical, respectively), that the pumping discharge is constant, and that the drawdowns are small. The vertical component of the flow velocity is not neglected. The solution is therefore, equally valid in the vicinity and at large distances from the pumping well. In the latter case, it coincides with the Thesis solution. A method of matching the theoretical solution with drawdown measurements during pumping tests is outlined. By the matching method the horizontal and vertical hydraulic conductivities and the effective porosity of the aquifer may be determined. The method is illustrated by analyzing data from pumping tests carried out in three anisotropic aquifers. (Author)

ANALYSIS OF NON LINEARITIES IN GROUNDWATER HYDROLOGY: A HYBRID COMPUTER APPROACH,
California Univ., Los Angeles.
Venkateswararao Vermuri, and John A. Dracup.
Water Resources Res, Vol 3, No 4, pp 1047-1057, 1967. 12 p, 8 fig, 14 ref.

Descriptors: *Groundwater movement, *Equations, *Digital computers, *Analog computers, Model studies, Hydrology.
Identifiers: Navier-Stokes Equations, Hybrid computers.

A hybrid computer method to solve nonlinear partial differential equations describing the flow of fluids in underground formations is described. Using finite difference methods, the problems are first programmed by a flow chart for a pure digital computer solution. Because the ability of resistance networks to solve a set of simultaneous equations instantaneously is recognized, major matrix inversion subroutines in the digital flow chart are replaced by analog resistance network hardware. Incorporation of analog hardware drastically reduces the computation time involved in inversion of large matrices. The resistance network constructed on an analog computer patch board allows an unparalleled flexibility not available in a digital computer. (Author)

SCHEMES FOR HANDLING INCONSISTENT MATRICES.
Harvard Univ, Cambridge, Massachusetts.
Myron B. Fiering.
Water Resources Research, Vol 4, No 2, pp 291-297, April 1968. 2 append.

Descriptors: *Statistical methods, Correlation analysis, Efficiencies, Monte Carlo method.
Identifiers: *Inconsistent matrices, *Multivariate analysis, Algorithms, Eigenvalue, Consistency, Linear transformation.

The increasing role of multivariate statistical techniques, a trend based on the growing availability of computers and on pressures for streamlined representation of multidimensional arrays of data, carries with it the responsibility for using efficient methods to manipulate matrices and arrays. It frequently happens that all records in a multivariate system (of flow records, quality measurements, or whatever) are not equally long, and that some subsets of these records do not present a consistent pattern of correlation when the entire bivariate correlation matrix is reconstructed. If one or more estimate is such that the entire correlation matrix is rendered inconsistent, repairs must be effected before continuing the multivariate analysis. Two algorithms for systematically finding a set of adjustments that satisfy the requirements of consistency are given, however, the results are not unique. (Seneca-Rutgers)

STATUS EVALUATION OF SURFACE WATERS IN TEXAS.
Texas Agricultural and Mechanical Univ, College Station.
William J. Clark.
Rep, Biology Dept, 1966. 102 p, 6 tab, 296 ref, 2 append. OWRR Project A-005-Tex.

Descriptors: *Texas, Publications, *Bibliographies, *Personnel, Fish, Organizations, Limnology, Aquatic microbiology, Inland waterways, *Surface waters, Evaluation, Reviews.

Data have been gathered concerning publications, personnel, and government organizations related to the limnology, aquatic biology and ichthyology of the inland waters of Texas. A total of 289 citations of published papers, dissertations and thesis have been found and organized by a computer program into a Keyword in Context (KWIC) index and an alphabetical bibliography. Reports of the Texas Parks and Wildlife Department containing pertinent information are indexed in an alphabetical table by name of the body of water studied. A partial list of taxonomic papers from bordering states is included as an appendix. Addresses, names of pertinent officers and personnel, and a brief description of duties and jurisdictions, are listed for 17 state and federal agencies. Course titles and instructors names are listed for pertinent courses at 13 colleges and universities in the state.

A STORAGE AND RETRIEVAL SYSTEM FOR THE NEVADA WATER RESOURCES DATA CENTER.
Nevada Univ, Reno.
L. Crouse, and G. B. Maxey.
Water Resour Res Center, Proj Rep 5, Desert Res Inst, Feb 1967. 13 p, 2 ref. OWRR Project A-010-Nev.

Descriptors: *Data storage and retrieval, Computer programs, Data processing, Data transmission, *Information retrieval, Data collections, Nevada, *Water resources, Water resources development.

The objective of the data center is to provide an information storage and retrieval system to facilitate water resource research. Because data is widely scattered in the files of different government and other agencies, items are not in standard format, and calculations often have to be made by hand, or, if a computer program is used, has to be coded by key punching, and the time and expense these problems incur, much water resource data which could be used is not. The data center alleviates these problems by providing uniform data formats, efficient storage, rapid retrieval and the integration of routine calculations into the main storage and retrieval program. The center collects and formats incoming water resource data then processes, stores and retrieves it on a computer system. It allows the researcher to have quick access to information in standard formats, with routine calculations automatically made for him, and enables him to easily and quickly call for sort and up-date operations. The progress of the Nevada Water Resources Data Center to date is included. (J. Phoenix-Nevada).
W69-01118

STORAGE AND RETRIEVAL OF DATA FOR WATER QUALITY CONTROL.
Federal Water Pollution Control Administration, Washington, D C.
Richard S. Green.
Fed Water Pollut Contr Admin, Aug 1966. 36 p, 13 fig, 4 tab, 2 ref, 3 append.

Descriptors: Water quality control, Information retrieval, *Data storage and retrieval, Data collections, Computer programs, Hydrologic data, *Water quality.
Identifiers: *Water quality data, *STORET.

This system for the storage and retrieval of data for water quality control was developed from ideas brought together in a brief informal conference held in the Basic Data Branch, Division of Water Supply and Pollution Control, U.S. Public Health Service, in August 1961. In this publication the following information is presented: (1) The current water quality control data handling situation, (2) Scope of the system, (3) The system design, (4) Storage procedure, (5) Deleting and changing data, (6) Use of data from other systems, (7) Retrieval routine.

INVENTORY OF PRINTED INFORMATION AND DATA PERTAINING TO WATER AND RELATED RESOURCES OF NEVADA.
Nevada Univ, Reno.
Hugh A. Shamberger.
Center Water Resour Res, 1967. 144 p, 1300 ref.

Descriptors: *Water resources, Bibliographies, Publications, Water resources development, Information retrieval, *Nevada.

This publication attempts to inventory all of printed information pertaining to Nevada's water resources together with a fairly complete listing of related resources publications. This publication is divided into 2 basic indexes: an author index and a subject index. Reports prepared for an agency but listing individual authors have been listed under the authors index as well as the agency name. Papers prepared for agencies which do not identify the author are indexed according to agency name. Listing of authors and subjects is alphabetical. When there are 2 or more coauthors, the first named is considered the senior author and the subject matter is listed under his name. The names of the coauthors are listed and referenced to the senior author. The subject index does not cover every paper in the author index but is sufficiently complete to meet most demands.
W69-01128

PERMUTED TITLE INDEX--1963.
Cornell Univ, Ithaca, N Y.

Water Resour Center, 1963. 90 p, 1298 ref. OWRR Project A-999-NY.

Descriptors: Reviews, Publications, *Water resources, Documentation, *Bibliographies, Technical writing.
Identifiers: *Current awareness.

Cornell University Water Resources Center has instituted a current awareness service in the water resources area. This service consists of a monthly list of journal articles, books, and reports randomly organized and an annual Permuted Title Index, sometimes called a KWIC (Key Word in Context) index, including the titles which have appeared in the current awareness list. This service provides a convenient and time-saving method of browsing current literature. An alphabetical list of journals regularly searched for water resource related papers is included. This list is limited to sources originally published in the English language or are regularly translated.
W69-01138

PSYCHROMETRIC TABLES FOR WYOMING,
Wyoming Univ, Laramie.
Paul A. Rechard.
Water Resour Res Inst, Aug 1967. 31 p, 10 tab. OWRR Project A-001-WYO.

Descriptors: *Psychrometrics, *Humidity, *Dew point, Barometric pressures, Meteorology, *Meteorological data, Temperature, Wyoming.

To facilitate the computation of relative humidity and dew points from sling psychrometer readings at the higher elevations experienced in Wyoming, tables of these parameters related to dry-bulb temperatures and wet-bulb depressions are presented for atmospheric pressures of 19, 21, 23, and 25 in. These pressures correspond roughly to elevations of 12,000-, 9,500-, 7,000-, and 4,800-ft MSL. The equations and data for making the computations are included.

CONSTRUCTION PERMITS FOR DAMS, DIKES, OR LEVEES.

Ohio Laws 1967, Ch H589.

Descriptors: *Legislation, *Ohio, *Dam construction, *Permits, Dams, Dikes, Levees, Administrative agencies, Estimated costs, Engineers estimates, Inspection, Public health, Regulation, Spillways, Water levels, Impoundments, Storage capacity, Judicial decisions.
Identifiers: Attorney General, Injunction.

LIBRARY U. OF I. URBANA - CHAMPAIGN

No dam may be constructed for any purpose, nor shall any dike or levee be constructed for the purpose of diverting or retaining flood water, unless the chief or the chief of the division of water has issued a construction permit. Five categories exist for which such permits are not required. Before a permit may be issued, two copies of the plans and specifications, including a detailed cost estimate, for the proposed construction prepared by a registered professional engineer shall be filed with the chief. The chief shall issue or deny a permit within thirty days from the date of the recept of the application. The chief may deny a permit if he finds that a dam, dike, or levee built in accordance with the plans and specifications would endanger life, health, or property. The decision of the chief is subject to appeal. The chief or a registered professional engineer must make inspections during construction. If construction is in violation of the permit, the chief may order construction to cease. The attorney general may bring an action for an injunction to enforce an order of the chief. (Smodish-Fla)

INSPECTION OF PROJECT WORKS WITH RESPECT TO SAFETY OF STRUCTURES - SETTLEMENTS INVOLVING HEADWATERS - RELICENSING OF PROJECTS.

18 CFR 12.1-12.6, 13.1, 16.1-16.5 (1968).

Descriptors: *Federal Power Act, Projects, *Dams, *Inspection, Storage capacity, Settlement, Movement, Erosion, Seepage, Contracts, Stress, Hydrostatic pressure, Leakage, Administrative agencies, Regulations.
Identifiers: Federal Power Commission, *Non-federal power developers.

Dams exceeding 35 feet in height with a storage capacity of 2000 acres feet which are licensed under Part 1 of the Federal Power Act must be inspected every 5 years. This inspection is of settlement, movement, erosion, seepage, leakage, cracking, stress, and hydrostatic pressures in structures. When the inspection indicates conditions of concern, the Federal Power Commission shall cause additional inspections. Qualified independent consultants are responsible for the inspections. They must file reports and include their recommendations. The licensee is required to submit a plan of action. Contracts may be entered into by licensees and permittees having headwater improvements and downstream non-federal power developers who receive power benefits. Projects not recaptured by Congress upon the expiration of the license and projects not subject to recapture may be relicensed. The various requirements for relicensing are provided. The inspection requirements have a retroactive effect. (Childs-Fla)

RECTANGULAR CUTTHROAT FLOW MEASURING FLUMES,
Utah State Univ, Logan.
Gaylord V. Skogerboe, and M. Leon Hyatt.
Proc Amer Soc Civ Eng, J Irrig Drain Div, Vol 93, IR4, Pap 5628, pp 1-13, 1967. 13 p, 9 fig, 1 tab, 7 ref, append. OWRR Project B-006-UTAH.

Descriptors: *Discharge measurement, *Water measurement, *Flumes, Measuring instruments, Hydraulics, Installation, Maintenance, Laboratory tests, Subcritical flow, Open channel flow, Hydraulic structures, Design criteria, Submergence, Discharge coefficients.
Identifiers: *Cutthroat flumes, Submerged flow.

Rectangular cutthroat flumes have been developed, and their roles in water measurement, along with the advantages of their use, are discussed. Dimensions and criteria for constructing cutthroat flumes are given. Differences between free flow and submerged flow conditions are examined, along with the necessary criteria for determining which flow regime exists. The value of the transition submergence is listed for each of the rectangular cutthroat flumes investigated. The free flow analysis and tables are presented for the cutthroat flumes studied, as are the 3-dimensional calibration curves used when the submerged flow exists in the flumes. Examples illustrating free and submerged flow operation are included. Proper installation and maintenance procedures for cutthroat flumes are described, as well as techniques for measuring flow depth which will yield satisfactory results.

ANALYSIS OF SUBMERGENCE IN FLOW MEASURING FLUMES,
Utah State Univ., Logan, Eng Dept.
Gaylord V. Skogerboe, and M. Leon Hyatt.
Tour of Hydraulics Div, Proc Amer Soc Civ Eng, Vol 93, No HY4, Pap 4348, pp 183-200, July 1967. 18 p, 15 fig, 12 ref, append. OWRR Project B-006-Utah.

Descriptors: Open channel flow, *Water measurement, Hydraulics, *Flow measurement, Hydraulic structures, *Flumes, Roughness, Critical depth, *Subcritical flow, Laboratory tests, Measuring instruments, Control structures, *Submergence, Parshall flumes.
Identifiers: *Submerged flow, Boundary conditions, Free flow, Trapezoidal flumes.

The calibration curves which describe submergence in flow-measuring flumes are developed by a combination of dimensional analysis and empiricism. The parameters developed in this manner are further verified by the theoretical submerged flow equation developed from momentum relationships. A flat-bottomed rectangular measuring flume was used to generate data necessary for establishing the parameters describing submerged flow. The resulting form of the discharge equation has been verified for a trapezoidal flat-bottomed flume and a Parshall flume. For any particular flume geometry, both the free flow and submerged flow equations can be placed on a single graph.

8C. Hydraulic Machinery

UNION ELEC CO V FPC (CONSTRUCTION OF POWER PLANT ON NON-NAVIGABLE STREAM).

326 F 2d 535-554 (8 Cir 1964).

Descriptors: *Federal Power Act, Missouri, *Hydroelectric project licensing, *Hydroelectric plants, Federal jurisdiction, State jurisdiction, Sluice gates, Spillway crests, River flow, Navigable waters, non-navigable waters, Hydroelectric power, Transmission (Electric), Pumped storage, Judicial decisions, Interstate rivers, Turbines.
Identifiers: Black River, Federal Power Commission.

The Federal Power Commission held that the Union Electric Company would have to procure a license for construction of a high head pumped-storage electric generating station on the East Fork of the Black River in Missouri. Power is generated by water flowing into a lower pool. The water then is pumped back into an upper reservoir for re-use. The Federal Power Act provides for said license if the Commission finds that any construction project in any non-navigable stream affects interstate or foreign commerce. The court held that the Commission ruling was an order subject to review. The Commission found that the interests of interstate commerce would be affected because the navigability of the Black River was affected. This finding and order were set aside because there was not substantial evidence to support them. Based on an 18-year record of flows the station could only adversely affect the flow one-half of 1 percent of the time and this would only occur if certain circumstances, such as malfunction, occurred. That the electricity produced would be transmitted interstate has no bearing on the licensing statute. McDermott-Fla)

OPTIMIZATION OF A NUCLEAR POWER PLANT BY HYBRID COMPUTER,
Electronic Associates, Inc., Princeton, N. J.
Joseph J. Kovacs.
Comput Automat, Vol 17, No 7, pp 26-31, July 1968. 6 p, 5 fig, append.

Descriptors: *Computers, Analog computers, Digital computers, Optimum use, *Computer programming, Economics, *Nuclear powerplants, Simulation, Control systems, Costs, Data collection systems, Data reduction, Systems analysis, Automation, Mathematical analysis, *Operations research, Data transmission systems, Solutions, Models, Power system operations.
Identifiers: *Analog-digital computers, Problem solving, Procedures, *Optimization, Variables.

The operation of a nuclear powerplant was studied using the Electronic Associates, Inc 8900 Hybrid Computer System. The purpose was to determine the most economical way to simulate kinetic behavior of a nuclear power station and related control system. Ordinary digital methods of calculating such a complicated control system are uneconomical and impractical because over 400 days of continuous computer time would be required. The subject of this study and the computational technique are unusual. The objectives that led to the use of a hybrid computer facility and the physical system used are described. The programming techniques that resulted in the computer model of the powerplant are outlined. The economy and fast result-yielding capability of the hybrid approach are demonstrated as follows: (1) the 10 times faster-than-real-time speed of the hybrid model gives speed advantage over the digital approach by a factor of 200; (2) the economic advantage of the hybrid over the digital approach is 400 to 1; and (3) the economic advantage of the hybrid over the pure analog approach is 50 to 1.

Federal career administrators are responsible for studying our Federal system of government to find ways to meet the needs of the people and the times, and to find means for accomplishing this within the framework of Federal and state constitutions and laws. Career managers must aid political executives in building a Federal system that is people-oriented and capable of dealing with the growing complexity and interdependence of all segments of our society. Since these problems often are not nationwide, decentralization of Federal agencies and cooperation with state and local governments, agencies, and nongovernmental entities are essential. The Federal career executive must devise coordinated and interlocking activities to solve deep-rooted social and economic problems, and become actively concerned with the politics of programs and policies without partisanship. He must relate his responsibilities to the public good by studying values and providing continuity and historical perspective to his programs. His role is to get work done, decisions made, and policies carried into effect through the management and leadership of people, ideas, and resources. He must use new technologies and advances, computer sciences, behavioral sciences, social sciences including economics, and communications.

FOURTH ANNUAL REPORT - FISCAL YEAR 1967-68.
Clemson University, Clemson, S. C.

Water Resources Research Institute, Clemson University, Fourth Annual Report Fiscal Year 1967-68, 81 p, July 1968, 17 ref.

Descriptors: *Research, *Projects, *South Carolina, *Training, *Education.

Summaries of research performed during the year 1967-68 under each of ten allotment projects and four matching grant projects are presented. Work remaining to be accomplished is included on five new allotment projects and one new matching grant project. One or more projects contribute to overall research on the nature of water, the water cycle, water quality management and protection, water resources planning and engineering works. The portion of the report on training and education gives statistics on new staff and facilities, interdisciplinary arrangements and student enrollment in water resources. Report of involvement of the Institute in public affairs is emphasized through research, sponsorship of a conference, and participation by individuals in such activities as the Governor's Advisory Committee, State Agencies, and State Boards. ANNUAL REPORT FISCAL YEAR 1968 WATER RESEARCH INSTITUTE,
West Virginia Univ, Morgantown, Water Research Inst.
Chester L. Dodson.
Annual Repts, FY 1968, 1968, 69 p.

Descriptors: *West Virginia, *Education, Training, Water resources, Acid mine water, *Water quality, *Environmental effects, Project purposes, Small watersheds, Fisheries, Fish management, Conservation, Management, Water law, Legislation, Publications, Research and development, Runoff, Project benefits, Standards, Waste treatment, Sediments, Iron, Clays.
Identifiers: *Annual report, Education and training, Project progress, *Water research institute, *Water research, Water-quality standards.

This is a routine annual report. It reports on progress made for 17 projects: 10 biologic, 4 hydrologic, and 3 geochemical. Most of them are related to acid mine water or water quality. Biologic projects involve study of environmental effects and seeking new methods for waste treatment. Hydrologic projects include small-watershed and precipitation-distribution studies. Geochemical projects involve sediment in reservoirs and water in flooded mineshafts. Results will be used in planning water-quality standards, sports fisheries, runoff-and-precipitation analyses, and additional research. Some unpublished results are now usable. Some results will be published in FY 1969. Education and training data show a numerical relationship of this field to research. The Director and members of the Institute participate in representative public meetings to gain knowledge needed to plan research related to 'real life' conditions and to disseminate information to the meeting attendees. The Institute is working with a legislative committee studying West Virginia water-law needs. (Author)

ANNUAL REPORT OF ACTIVITIES FOR FISCAL YEAR 1968 WATER RESOURCES CENTER, UNIVERSITY OF MAINE,
Maine Univ, Orono, Maine.
W. Viessman, Jr.
Annual Report of Activities for Fiscal Year 1968 Water Resources Center, University of Maine, Publication No. 4, June 1968, 38 pp, 2 append, disc.

Descriptors: Water resources, Water quality, Hydrology, Soil moisture, Watershed management.
Identifiers: Water resources research, Maine water problems.

A discussion of the accomplishments of the Maine Water Resources Center for fiscal year 1968. Involvement of the Center in research, education and training, and coordination of various water resources activities is outlined. Individual research reports on continuing projects are included. (Author)
W69-00909

ANNUAL REPORT TO OFFICE OF WATER RESOURCES RESEARCH FOR FISCAL YEAR ENDING JUNE 30, 1968,
Minnesota Univ, St. Paul, Minn.
William C. Walton.
Minnesota Water Resources Research Center, Mimeographed Report, August 1968. 96 p, 3 fig, 30 tab, 10 ref.

Descriptors: *Water Resources Research, *Minnesota Water Resources Research Center, *Fiscal Year 1968 Annual Report.

The University of Minnesota established on September 1, 1964, in the Graduate School an interdisciplinary Water Resources Research Center. The Center has responsibility for unifying and stimulating University water resources research through the administration of funds associated with the Water Resources Research Act and made available by other sources and assisting in training additional scientists for work in the field of water resources through research. The Center financed 14 research projects involving 11 faculty members during Fiscal Year 1968. These research projects were concerned with pothole drainage and groundwater resources, movement of water through soils, overfertilization of lakes and streams, surface water runoff, water law in Minnesota, and water quality management. During the 1966-67 academic year, there were 35 seniors, 38 master's degree students, and 26 doctoral students using equipment and supplies purchased wholly or in part by the Center. About 45 students received employment as research assistants through the Center's program. (Author)

INSTITUTE OF WATER RESEARCH ANNUAL REPORT FOR 1967-1968,
Michigan State Univ, Lansing, Water Resources Research Institute.
Robert C. Ball, and Niles R. Kevern.
Annual Report for 1967-1968 of Water Resources Research Sponsored under Public Law 88-379 in Michigan, 1968.

Descriptors: Allotments, Training, Farm ponds, Hydrogeology, Geologic mapping, Glaciers, Pesticide residues, Tertiary treatment, Adsorption, Limnology, Forest soils, Soil disposal fields, Nitrates, Phosphates, Watershed management.
Identifiers: Michigan.

The report includes brief descriptions of eleven allotment grant projects and three matching grant projects funded under Public Law 88-379. There were five allotment projects in engineering on waste water handling and treatment, four in biology on limnological aspects of pollution, one in geology on groundwater, and one in hydrology concerned with properties of forest soils. All matching grants were in geology, one on glaciology and two on groundwater research. The Institute in Michigan advised on the development of two new watershed councils, cooperated with an existing council on stream monitoring, and served in an advisory capacity to State and Federal agencies on topics of water quality standards, pesticide problems, pollution, and water resources research programs. Interest in water resources research was stimulated through seminars, development of new courses, and meetings of Campus research leaders. The report includes a summary of the scope of college training of water resources majors at four Michigan universities. (Kevern-Mich State)

ANNUAL PROGRAM REPORT, FISCAL YEAR 1968 PUBLICATION AUGUST 15, 1968,
Missouri Univ, Columbia, Missouri Water Resources Research Center.
George E. Smith.
Water Resources Research Center.

Descriptors: *Water Resources Research Act, *Missouri, Karst, Evapotranspiration, Flow, Legislation, Trace elements, Vibrations, Ecology, Chemistry, Groundwater, Roughness, Irrigation efficiency, Mine wastes, Sewage lagoons, Sediment transport, Water districts, Mine drainage, Soil permeability.
Identifiers: *Annual reports.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Contains progress reports on 16 water resources research projects and planned studies on 12 new investigations. Included are studies of effects of ultrasonic vibrations on aerated biological systems; chemistry of water and improved chemical methods for trace amounts of ions in water; alternatives for water resources regulations, methods for measuring stream flow, ecology in waste assimilation by streams; trace element studies in the Missouri River; stream pollution in the 'Lead Belt', environmental factors in multi-purpose reservoirs; water penetration and storage in selected areas; analysis of public water supply districts; transport of sediment; separation of suspended solids, and sorption of chlorinated hydrocarbons by clay minerals. Information is included on the training of students in water science. Reports are given on participation in short courses and conferences pertaining to water resources. Also listed are activities of the Water Resources Research Center in contributing to public and academic affairs and for the promotion of improved water conservation and management. (Author)

INVENTORY OF RESEARCH IN WATER POLLUTION AND RELATED FIELDS: COLUMBIA BASIN AND PACIFIC COAST STATES.
Federal Water Pollution Control Administration, Corvallis, Oreg.
Lyman J. Nielson.
Fed Water Pollut Contr Admin Rep, Nov 1966. 135 p. Pub Health Serv-FWPCA Project 1263.

Descriptors: *Pacific Coast Region, *Pacific Northwest U.S., Alaska, *Columbia River Basin, Water pollution, California, *Water pollution, Control, Research and development, Hawaii, Idaho, Montana, Washington, Oregon, Wyoming, Utah.
Identifiers: British Columbia, Canada.

This is the seventh inventory of water pollution research for the Columbia River Basin and Pacific Coast States. In addition to the abstract of each research project, this issue provides information relating to distribution of efforts in various areas of water pollution research. Each researcher submitting data for the inventory was asked to indicate the pertinent research area or areas of his project. The data submitted are given in three tables. Table I, Allocation of Financial Resources, provides information on the relative distribution of research funds. Table II is a summary of the source of research funds. Table III provides data on personnel resources. The research summaries are grouped alphabetically by states. Each project has been numbered for indexing. In the research index each project is listed under all pertinent areas. The listing of each research project contains the following basic information as submitted: (1) title of project, (2) name of institution doing research, (3) summary or abstract of project including objectives, (4) date project was started, (5) estimated duration of project, (6) name of principal investigator, (7) number and disciplines of personnel on project, (8) equipment used, and (9) pertinent publications.

FISCAL 1968 ANNUAL REPORT OF THE WATER RESOURCES CENTER,
Pennsylvania State Univ, University Park, Pa.
John C. Frey, and E. Bruce Jones.
Institute for Research on Land and Water Resources, Information Report No. 56, University Park, Pa., Aug. 1968. 178 p, 5 append.

Descriptors: Acid streams, Eutrophication, Water pollution, Waste water disposal, Carbonates, Hydrogeology, Watershed management, Water pollution sources, Phosphates, Escherichia coli, Sewage effluents, Aquatic microbiology, Demand, Supply, *Training, *Universities, Grants, *Education, Allotments, Pennsylvania.

Twenty OWRR projects have been conducted during the 1967-68 Fiscal Year at the Water Resources Center of the Institute for Research on Land and Water Resources. The research projects concerned the neutralization of acid streams, stream eutrophication, stream pollution, waste water renovation, carbonate hydrogeologic environments, watersheds, numerical simulation of groundwater flow systems, phosphate removal from water, simplification of integrated stormwater planning, significance of Escherichia coli serotypes in sewage effluent and water supplies, and water demand-supply analyses. A 'Training and Education' section includes the names, degrees, and departments of students who have assisted the principal investigators of OWRR projects during some phase of their research. A listing of the public activities of the directors of the Institute and the principal investigators of OWRR projects during Fiscal Year 1967-68 is also included. These activities are listed under 'Meetings and Seminars,' 'Committees and Special Appointments,' and 'Public Law' headings. (Sink-Pa State)

1968 ANNUAL REPORT - WRRI - UNC, 34 pp, July 1968,
North Carolina State Univ, Raleigh, N. C.
David H. Howells.
Water Resources Research Institute, Raleigh, N. C.

Descriptors: *Water Resources Research Act, Allotments, Grants, Training, Universities.
Identifiers: Flood routing, Currents (Water), Pesticide residues, Methodology, Model studies, Eutrophication, Economic impact, Planning, Environmental effects.

Principal thrust was to expand research program with major new commitments for FY 1969 by the Raleigh and Chapel Hill campuses. The FY 1968 annual allotment was supplemented by $20,000 in University funds and additional $38,000 in services and facilities. Projects scheduled for completion in FY 1968: Routing of Flow in Streams in N. C.; Diffusion and Dispersion in Porous Media; Movement of Water in N. C. Soils and Effect on Water Quality; Ecology, Present and Alternative Future Land Use Patterns in Dismal Swamp; Current Study of Neuse River and Estuary; Oxygenation of Iron (II) in Continuous Reactors; Lake-Oriented Residential Subdivisions; Simulation of Regional Economic Impacts of Water Resources Development; Pigment Indices of Environmental Oxygen Stress. Projects continuing: Inventory of Water Resources in N. C.; Design of Monitoring System for Pesticides; Computer Simulation of Aquifers. Matching Grant projects: Exchange of Phosphorus Species Between Living and Nonliving Systems; Changes During Eutrophication of an Estuary. A graduate minor in water resources was offered for the first time. Six seminars were presented. Institute faculty were active in public affairs relative to water resources planning and management. The Institute Newsletter continued as the primary means of communication with public. (Author)
W69-01195

KANSAS WATER RESOURCES RESEARCH INSTITUTE ANNUAL REPORT FOR FISCAL YEAR 1968,
Kansas State University, Manhattan, Kansas.
Hyde S. Jacobs.
Kansas Water Resources Research Institute.

Descriptors: Evapotranspiration, Microclimatology, Regimen, Pesticides, Animal wastes, Fertilizers, Aerobic treatment, Groundwater movement, Dispersion.

The report contains brief summaries on institute involvement in public affairs, region approaches to water resources research, institute involvement in academic affairs, significant technical accomplishments, expected results from incomplete projects, publications resulting from the institute's research and brief narrative reports on the ongoing research. Technical accomplishments on such research as: animal feedlot pollution, nitrate removal from potable water, activity patterns of fish exposed to toxic materials, step aeration waste treatment systems, water contamination by pesticides, nitrate accumulation in groundwater and numerical modeling of groundwater flow are discussed. A summary of expected results on inorganic material removal, weather modification, microclimatology, evapotranspiration reduction, moisture use by wheat, logitudinal dispersion in river basins, groundwater recharge, river course and regimen, nitrate accumulation in water, pesticide contamination of water, feedlot pollution and aeration waste treatment systems is also included. Budgets for all matching grant and allotment grant projects as well as an over all budget summary are given. (Powers-Kansas State)
W69-01196

FOURTH ANNUAL REPORT, UNIVERSITY OF IDAHO. WATER RESOURCES RESEARCH INSTITUTE,
Idaho Univ., Moscow.
C. C. Warnick.
Annual Report - Water Resources Research Institute - Idaho, Volume 4, 79 p.

Descriptors: Literature, Education, Research Act Allotments.
Identifiers: Reports, Annual.

A resume of activity on 10 Allotment type research projects and one Matching Grant project was summarized. Three projects were completed including a study on movement of water from canals to the groundwater reservoir, a microclimate study of a transection across a river valley, and a study of indices for classifying chemicals which affect water quality for aquatic life. The Institute also assisted in initiating four separate water related studies in the University with the Idaho Water Resource Board. On one of these the Institute completed a two volume Water Inventory for Idaho. Ten graduate students were actively engaged in research projects supported by Office of Water Resources Research funding. (Author)

ANNUAL REPORT FOR FISCAL YEAR 1968,
South Dakota State Univ., Brookings, South Dakota. Water Resources Institute.
John L. Wiersma.
South Dakota Water Resources Institute, No. 3 Aug 1968. 121 p.

Descriptors: *Training, *Program, Agriculture Animal wastes, *South Dakota, Computer models Construction, Conservation, *Energy budget Evapotranspiration, Microclimatology, Sprinkle irrigation, *Water quality, Irrigation, Hydrographs Sinks, Synthesis, Spring, Salinity, Groundwate movement, Waste disposal, Permeability, Oxida tion lagoons.
Identifiers: *Report, *Public affairs, Biocides Economic potential, Information retrieva Resources inventory, Primary production.

The Water Resources Institute supported fourtee active research projects with emphasis placed o water supply augmentation and conservation i agriculture. The developing irrigated agriculture a well as the predominate dryland agricultur received attention. Water resources plannin received special attention including an evaluatio of the potential contribution of water resourc development in light of the Missouri River Basi development. Irrigation, as well as effect of larg water impoundments have received attention. predictive model is being tested. Water quali management and protection was studied in the lig of potential groundwater contamination fro urban refuse disposal as well as agricultural poll tion to surface waters including the determinatio of the levels of chemical biocides in the ecosyste of a prairie lake. The water retention chara teristics of waste water stabilization ponds was st died with results dictating revised design standard The program involved 230 students of which 1 graduated with 33 being employed by the Institut

9 disciplines with 6 new courses and 8 new staff members were represented. The Institute is becoming involved in public affairs through conferences and committees. (Author)

ANNUAL REPORT - NEW JERSEY WATER RESOURCES RESEARCH INSTITUTE - 1967-1968,
Rutgers - the State University, New Brunswick.
William Whipple, Jr.
New Jersey Water Resources Research Institute 74 p, 6 illus, 2 tab.

Descriptors: Research grants, Research facilities, Water resources development, Economics, Urbanization, Biochemical oxygen demand, Dissolved oxygen.
Identifiers: Water resources research administration, Oxygen dynamics of streams, Metropolitan area water resources, Artificial river aeration.

A report on research and training activities of the New Jersey Water Resources Research Institute during fiscal year 1967-68 under provisions of P.L. 88-379. Includes mainly activities at Rutgers - the State University of New Jersey, with participation in specific projects by Princeton University and Stevens Institute. Research involved was funded mainly by the Office of Water Resources Research, but also by the Federal Water Pollution Control Administration, New Jersey State Department of Conservation and Economic Development, New Jersey State Department of Public Health, and the Delaware River Basin Commission. The program emphasizes three main fields of activity: (1) Oxygen dynamics and biochemical oxygen demand of streams, (2) metropolitan area water problems, and (3) economics of water resources. FOURTH ANNUAL REPORT OF THE ARIZONA WATER RESOURCES RESEARCH CENTER,
Arizona Univ, Tucson.

Water Resources Research Center, The University of Arizona, Tucson, Arizona 85720. 57 p, August, 1968.

Descriptors: *Annual Report, Research, Education, Training, OWRR Programs.
Identifiers: *Arizona, *Water Resources Research Center, Annual Report FY '68.

The publication contains a brief summary of the research projects conducted in Arizona through the Water Resource Research Center. A financial summary of each project is included. New personnel and new courses of the Hydrology and Water Resources Program at The University of Arizona are listed. Research Projects summarized include studies of Gravity and Magnetic Surveys for Water Explorations, Soil-Water-Plant System Analysis, Salinity Effects on Plants, Social and Economic Studies of Water Use, Operations Research Methods Applied to Water Management, Soil Treatments to Increase Runoff, and a study of Trace and Tracer Elements in Ground Water.
W69-01201

ANNUAL REPORT, WATER RESOURCES RESEARCH ACTIVITIES UNDER PUBLIC LAW 88-379, FISCAL YEAR 1968, GEORGIA INSTITUTE OF TECHNOLOGY.
Georgia Institute of Technology, Atlanta, Georgia.

Water Resources Center, Georgia Institute of Technology, WRC-0368, August 1968. 108 p, 4 photos, 6 tab.

Descriptors: Ion exchange, Oxygen (Balance), Impoundment limnology, Piezometric surfaces, Cation adsorption, Phosphorous, Polarographic analysis, Hydrologic budget, Heavy metals, Aquatic ecosystems, Georgia water law, Ground water movement, Textiles, Stratified flow, Radioactive wastes, Manganese, Attitudes, Metropolitan planning, Water users.
Identifiers: Georgia, University of Georgia, Georgia Institute of Technology, Water resources research activities.

Progress on 24 projects in the research program active during FY 1968 and activity expected on 10 projects to be initiated in FY 1969 is outlined. Significant accomplishments to date and accomplishments anticipated for these projects are discussed. Three of the projects in the program deal with the nature of water; 8 of the projects are concerned with the water cycle, covering the hydrologic cycle, including water and plants, erosion and sedimentation, chemical processes, and estuarine problems; 2 are in the field of water quantity management and control; 8 deal with water quality management and protection; 10 are concerned with water resources planning, a good example of which is 'Interrelations between River Basin Developments and Development of Metropolitan Areas'; 1 involves the development of a method of determining and mapping the hydrologic response of ungaged watersheds in the Southeast; and 2 are in the field of engineering works. Information on student involvement and the training and educational aspects of the research program at both Georgia Tech and the University of Georgia is included. Involvement in professional, public service, and academic activities of personnel at Georgia Tech and the University of Georgia who are associated with the PL 88-379 research program is discussed.
W69-01202

ANNUAL REPORT 1967-1968.
Hawaii Univ, Honolulu.

Ann Rpt 67-68, Sept 1968. 126 p, 24 fig.

Descriptors: Hawaii, Floods, Hydrogeology, Aquifer characteristics, Geophysical exploration, Well logging, Ground-water tides, Ground-water recharge, Ground-water pollution, Water color, Tracers, Estuarine pollution, Hydrologic data, Irrigation, Evapotranspiration, Water values.

Annual progress report on the research program of the University of Hawaii Water Resources Research Center: the work reported includes studies of floods in small watersheds, aspects of the geohydrology of certain areas on Oahu, Maui, and Hawaii, surface geophysical exploration for ground water and geophysical well logging, tidal oscillations in ground water, identification of groundwater pollution effects, the pollution of certain estuaries, the removal of color from surface water, water tracing and dating, the design of hydrologic data network, the water use of sugar cane, and the value of water for irrigating sugar cane. (D. C. Cox-Hawaii).

FOURTH ANNUAL REPORT. PURDUE UNIVERSITY WATER RESOURCES RESEARCH CENTER. F.Y. 1968.
Purdue Univ, Lafayette, Indiana.
Dan Wiersma.
Report issued from Center Sept. 1, 1968. 93 p, 9 fig.

Descriptors: *Indiana, *Water Resources Research Act, *Training, Manpower, Allotments, Universities.

Purdue University Water Resources Research Center is supporting projects in watershed hydrology, geomorphology of stream beds and flood plains, classification of streams, statistical analysis of ground-water regimes, infiltration predictions, pesticide persistance in watersheds, urban hydrology, and water resources manpower needs. Some of the results reported included the development of a procedure whereby the runoff from small Indiana watersheds are predicted for any given storm; a statistical analyses of the ground water level regimes in Bartholomew County, Indiana delineating on the map areas of ground water surplus and deficiencies, and that the organophosphate and carbamate pesticide used on the Southern Indiana watersheds did not persist in the pond reservoirs nor in the soil of the watershed. In the latter results there were no effects on those terrestrial and aquatic organisms inventoried both before and after application of the pesticide. The report also contains a summary of the training activities in relation to water resources at the University. It also relates the water Resources Center's involvement in such activities as the State Water Plan, Legislative Advisory Committees, and Interstate Commissions. (Author)
W69-01204

REPORT OF UNIVERSITY OF KENTUCKY WATER RESOURCES INSTITUTE, FY 1968,
Kentucky Univ., Lexington, Kentucky.
Robert A. Lauderdale.
Report for FY 1968, Kentucky Water Resrcs Inst, Lexington, 1968, 141 p.

Descriptors: Recreation demand, Flood control, Pesticides, Strip mines, Non-structural alternatives, Water law, Chemical oxidation, Geochemistry, Water chemistry, Aesthetics, Soil water, Capillary water, Acid bacteria, Soil water movement.

During FY 1968 the University of Kentucky Water Resources Institute supported fourteen new or continuing projects under section 100 of P.L. 88-379. The subjects covered include (1) the economic analysis of alternative flood control measures, (2) persistence of pesticides in impounded waters, (3) the economic impact of flood control reservoirs, (4) ecological study of the effects of strip mining on the microbiology of streams, (5) chemistry of the oxidant ferrate, its interaction with specific organics found in waste water, (6) solution

LIBRARY U. OF I. URBANA - CHAMPAIGN

geochemistry of the water of limestone terrains, (7) aesthetic and recreational potential of small naturalistic streams near urban areas, (8) capillary-diffusion and self-diffusion of liquid water in unsaturated soil, (9) evaluation of the legal institutions of diversion, transfer, storage, and distribution of water in Kentucky, (10) a preliminary reconnaissance of areas to be impounded in the Salt River Basin of Kentucky, (indicates completion report available). The annual report includes statistical data on the training and other activities of the Institute during FY 1968. (Author)

10. SCIENTIFIC AND TECHNICAL INFORMATION

AN ANNOTATED BIBLIOGRAPHY OF OBSERVATIONS ON ILLINOIS WATER RESOURCES 1673-1850,
Illinois Univ., Urbana.
Thomas P. Schlunz, Robert M. Sutton, and George W. White.
Final Rep, Water Resour Center, Aug 1967. 77 p, 85 ref. OWRR Project A-017-Ill.

Descriptors: *Bibliographies, History, *Water resources, Natural resources, Evaluation, *Illinois.

This bibliography consists of travel narratives and descriptive accounts of Illinois written by observers who were in the state or who wrote of the state between the years 1673 and 1850. These limits were chosen because the first recorded European set foot on Illinois soil in 1673, and after the middle of the nineteenth century the official state and federal geological reports can be relied upon. The works included in this list were chosen because the authors of them recorded observations bearing on the state of the water resources in Illinois at the time of their visits or publication. The entries in the bibliography consist of the titles, an introductory and summary paragraph, and the pertinent selections from the works. The two criteria in assembling this bibliography were that the work contain matter relating to the water resources of Illinois, and that the work was published and therefore received wide circulation. The bibliography is arranged alphabetically. A chronological list of the works, in the order of the years of observation, when known, or by order of publication, follows the bibliography.

ANNUAL REPORT TO OFFICE OF WATER RESOURCES RESEARCH FOR FISCAL YEAR ENDING JUNE 30, 1968,
W69-00910 09D

FISHERIES
THE VALUE OF A TROUT STREAM FISHERY,
W69-01147 06A

FISHKILL
WATER QUALITY ALTERATION THROUGH ACID AND HEAT POLLUTION IN A 1500 ACRE RESERVOIR,
W69-00735 05C

FISH KILLS BY POLLUTION, 1966 SEVENTH ANNUAL REPORT.
W69-01123 05C

FLAME PHOTOMETRY
ATOMIC FLUORESCENCE FLAME SPECTROMETRY,
W69-00940 07B

FLASH FLOODS
SEQUENTIAL STUDY OF DESERT FLOODING IN THE WHITE MOUNTAINS OF CALIFORNIA AND NEVADA,
W69-01006 2E

FLOATING
A LABORATORY INVESTIGATION OF OPEN-CHANNEL DISPERSION PROCESSES FOR DISSOLVED, SUSPENDED, AND FLOATING DISPERSANTS,
W69-01180 02E

FLOATS
RESPONSE OF FLOAT TYPE STAGE RECORDER SYSTEMS,
W69-00919 07B

FLOOD CONTROL

LIBRARY U. OF I. URBANA - CHAMPAIGN

LOCAL ACTION AND ACCEPTANCE OF WATERSHED DEVELOPMENT,
W69-00716 04D

TENNESSEE VALLEY AUTHORITY.
W69-00758 06E

A STUDY TO DETERMINE THE STATE AND COMMUNITY RESPONSIBILITIES INHERENT IN FLOOD DAMAGE PREVENTION PLANNING IN URBAN DEVELOPMENT,
W69-00946 06F

OPTIMUM INVESTMENT IN STRUCTURAL FLOOD CONTROL,
W69-01083 06B

TOWARD COMPREHENSIVE WATER RESOURCES MANAGEMENT IN THE CALUMET UNION DRAINAGE SYSTEM.
W69-01093 06A

THE EFFECTS OF GEOGRAPHICAL AND CLIMATIC SETTING ON THE ECONOMIC ADVANTAGES OF ALTERNATIVE FLOOD CONTROL MEASURES,
W69-01172 02A

FLOOD DAMAGE
FLOOD CONTROL VIA THE POLICE POWER,
W69-00756 06F

HOLLEY V STATE (OBSTRUCTION OF DRAINAGE).
W69-00789 04C

LA TEMPORADA DE CICLONES DE 1967 Y SU CONTRIBUCION A LA PRECIPITACION ANNUAL EN MEXICO (THE HURRICANE SEASON OF 1967 AND THE CONTRIBUTION TO THE ANNUAL RAINFALL IN MEXICO),
W69-00942 02B

OPTIMUM INVESTMENT IN STRUCTURAL FLOOD CONTROL,
W69-01083 06B

AN ECONOMIC APPROACH TO COPING WITH FLOOD DAMAGE,
W69-01090 06F

FLOOD FORECASTING
SOME RECENT STUDIES ON NUMERICAL FLOOD ROUTING.
W69-00922 02E

FLOOD HYDROLOGY
HYDROLOGICAL DATA AND PEAK DISCHARGE DETERMINATION OF SMALL HAWAIIAN WATERSHEDS ISLAND OF OAHU,
W69-00709 02E

FLOOD IRRIGATION
DEVELOPMENT OF METHODS FOR INCREASING THE EFFICIENCY OF WATER USE IN CRANBERRIES,
W69-01001 03F

FLOOD PLAIN INSURANCE
FLOOD HAZARD PERCEPTION IN THE PAULINS KILL VALLEY, WARREN COUNTY, NEW JERSEY,
W69-00991 05F

AN ECONOMIC APPROACH TO COPING WITH FLOOD DAMAGE,
W69-01090 06F

FLOOD PLAIN ZONING
FLOOD CONTROL VIA THE POLICE POWER,
W69-00756 06F

A STUDY TO DETERMINE THE STATE AND COMMUNITY RESPONSIBILITIES INHERENT IN FLOOD DAMAGE PREVENTION PLANNING IN URBAN DEVELOPMENT,

GROWTH PATH
OPTIMAL ECONOMIC GROWTH AND DISTRIBUTION AND THE SOCIAL UTILITY FUNCTION,
W69-01108 06B

HARBORS
PROTECTION OF PORTS AND HARBORS.
W69-00804 06E

HAWAII
ESTIMATION OF GROUND-WATER CONFIGURATION NEAR PAHALA, HAWAII USING ELECTRICAL RESISTIVITY TECHNIQUES,
W69-00710 02F

INSTRUMENTATION FOR SEISMIC EXPLORATION FOR GROUND WATER IN HAWAII,
W69-00974 07B

HEAT
TIME-INTEGRATED THERMAL EFFECTS OF FOREST IRRIGATION.
W69-01141 05G

HEAT BUDGET
COMPUTATION OF THE COMPONENTS OF THE THERMAL BALANCE OF PLANNED RESERVOIRS,
W69-01035 02H

HEAT TRANSFER
EQUILIBRIUM SURFACE WATER TEMPERATURES,
W69-01058 02H

HERBAGE
GROWTH AND YIELD OF SAGEBRUSHGRASS VEGETATION IN RELATION TO PRECIPITATION AND TEMPERATURE,
W69-01008 02I

HERBICIDES
THE EFFECT OF SELECTED HERBICIDES UPON THE GROWTH OF PLANKTONIC FRESH WATER ALGAE AND THEIR PERSISTENCE IN SURFACE WATERS,
W69-00994 05G

PERSISTENCY OF 2,4-DICHLOROPHENOXYACETIC ACID AND ITS DERIVATIVES IN SURFACE WATERS WHEN USED TO CONTROL AQUATIC VEGETATION.
W69-01112 05G

HIGH PLAINS
RESEARCH IN GROUND WATER ECONOMICS IN THE HIGH PLAINS AREA OF COLORADO,
W69-00986 06D

HIGH-WATER MARK
MCKNIGHT V BROEDELL (TITLE TO RIPARIAN LAND).
W69-00872 06E

SUMMARY REPORT ON TITLE TO BEDS AND USE OF NAVIGABLE STREAMS AND LAKES IN IDAHO,
W69-00995 06E

HUMAN POPULATION
POPULATION TRENDS FOR THE PLATTE AND GREEN RIVER BASINS IN WYOMING 1890-2010,
W69-01158 06B

HUMAN RESOURCES
HUMAN RESOURCES AND REGIONAL DEVELOPMENT SOME LESSONS FROM FRENCH EXPERIENCE,
W69-01099 06B

HUMID AREAS
ESTIMATING EVAPOTRANSPIRATION IN A HUMID REGION,
W69-00939 02D

HUMIDITY
PSYCHROMETRIC TABLES FOR WYOMING,
W69-01159 07C

HYACINTH(WATER)
PERSISTENCY OF 2,4-DICHLOROPHENOXYACETIC ACID AND ITS DERIVATIVES IN SURFACE WATERS WHEN USED TO CONTROL AQUATIC VEGETATION.
W69-01112 05G

HYDRAULIC CONDUCTIVITY
BASIC WATER RESEARCH ON NEW ENGLAND SOILS,
W69-00929 02G

HYDRAULIC GRADIENT
SOME REMARKS ON NON-DARCY FLOW,
W69-01027 02A

HYDRAULIC SIMILITUDE
ON THE SIMILITUDE OF DISPERSION PHENOMENA IN HOMOGENEOUS AN ISTROPIC POROUS MEDIUMS,
W69-01042 02F

HYDRODYNAMICS
THE HYDRODYNAMIC AND ENERGY BUDGET ASPECTS OF PAN EVAPORATION.
W69-01136 02D

HYDROELECTRIC PLANTS
UNION ELEC CO V FPC (CONSTRUCTION OF POWER PLANT ON NON-NAVIGABLE STREAM).
W69-00852 08C

HYDROELECTRIC PROJECT LICENSING
UNION ELEC CO V FPC (CONSTRUCTION OF POWER PLANT ON NON-NAVIGABLE STREAM).

W69-00999 02D

SOIL TEMPERATURE
SOIL MOISTURE AND SOIL TEMPERATURE CHANGES WITH THE USE OF BLACK VAPOR-BARRIER MULCH AND THEIR INFLUENCE ON PINEAPPLE,
W69-00984 02G

SOIL WATER
CHEMICAL CHARACTER OF GROUND AND SURFACE WATERS IN RELATION TO SOIL WEATHERING PROCESSES,
W69-00925 02K

PILOT EVAPOTRANSPIRATION STUDY LYSIMETER DESIGN,
W69-00981 02D

SOIL MOISTURE AND SOIL TEMPERATURE CHANGES WITH THE USE OF BLACK VAPOR-BARRIER MULCH AND THEIR INFLUENCE ON PINEAPPLE,
W69-00984 02G

SOILS
THE ION-EXCHANGE REACTIONS OF RADIOACTIVE IONS WITH SOILS AND EFFECTS OF ORGANIC COMPOUNDS,
W69-00726 05B

BASIC WATER RESEARCH ON NEW ENGLAND SOILS,
W69-00929 02G

TO INVESTIGATE THE DISPOSAL OF AGRICULTURAL PRODUCT WASTES THROUGH THE SOIL,
W69-00990 05G

SOLUTES
ON THE SIMILITUDE OF DISPERSION PHENOMENA IN HOMOGENEOUS AN ISTROPIC POROUS MEDIUMS,
W69-01042 02F

SORPTION
ROLE OF CERTAIN STREAM-SEDIMENT COMPONENTS IN RADIOION SORPTION,
W69-01176 02K

SOUTH CAROLINA
AN ACT PROVIDING FOR THE CREATION OF WATERSHED CONSERVATION DISTRICTS.
W69-00793 04D

AN ACT TO CREATE THE AIKEN COUNTY AIR AND WATER POLLUTION COMMISSION AND TO DEFINE ITS POWERS AND DUTIES.
W69-00794 05G

FOURTH ANNUAL REPORT - FISCAL YEAR 1967-68.
W69-00808 09D

SOUTH DAKOTA
ANNUAL REPORT FOR FISCAL YEAR 1968,
W69-01198 09D

SPECTROMETERS
THE ANALYSIS OF AROMATIC COMPOUNDS IN WATER USING FLUORESCENCE AND PHOSPHORESCENCE.
W69-01114 05A

SPECTROPHOTOMETRY
THE SPECTROPHOTOMETRIC DETERMINATION OF NITRATE IN WATER USING 2-NITROSO-1-NAPHTHOL-4-SULFONIC ACID.
W69-01113 02K

SPOIL BANKS
TRUSTEES OF THE I. I. FUND - SALE OF SUBMERGED LANDS.
W69-00861 06E

SPRINGS
REMOTE SENSING OF HAWAIIAN COASTAL SPRINGS USING MULTISPECTRAL AND INFRARED TECHNIQUES,
W69-00982 07B

SPRINKLER IRRIGATION
TIME-INTEGRATED THERMAL EFFECTS OF FOREST IRRIGATION.
W69-01141 05G

STABILIZATION
TAX AND INCOME STABILIZATION,
W69-01086 06B

STAGE RECORDERS
RESPONSE OF FLOAT TYPE STAGE RECORDER SYSTEMS,
W69-00919 07B

STANDARDS
AN ACT RELATING TO WATER POLLUTION CONTROL AMENDING MINNESOTA STATUTES 1965, SECTION 115.44, BY ADDING A SUBDIVISION.
W69-00898 05G

STATE GOVERNMENTS
TRUSTEES OF INTERNAL IMPROVEMENT FUND V LOBEAN (SALE OF SUBMERGED LAND).
W69-00895 06E

WATER RESOURCES MANAGEMENT IN MARYLAND.
W69-00955 06E

STATE JURISDICTION
MANGROVE ISLANDS AND GROWTH AS LAND - FLOOD CONTROL DISTRI TAXES,
W69-00800 06E

TRUSTEES INTERNAL IMPROVEMENT FUND--AUTHORITY TO CONSTRUCT DOCKS, PIERS, WHARVES AND SIMILAR STRUCTURES,

W69-00806 06E

STATE-FEDERAL COOPERATION
AN ACT AUTHORIZING THE STATE OF INDIANA TO COOPERATE WITH THE UNITED STATES IN THE CONSTRUCTION, OPERATION AND MAINTENANCE OF MULTIPLE-PURPOSE RESERVOIRS.
W69-00790 04A

STATISTICAL METHODS
A TECHNIQUE TO DETERMINE EVAPORATION FROM DRY STREAM BEDS,
W69-01026 02D

OPTIMUM DENSITY OF RAINFALL NETWORKS,
W69-01046 07A

SCHEMES FOR HANDLING INCONSISTENT MATRICES.
W69-01063 07C

OCCURRENCE OF POOLS AND RIFFLES AN ELEMENT IN THE QUASI-EQUILIBRIUM STATE OF RIVER CHANNELS,
W69-01166 02J

STATISTICAL MODELS
THE USE OF STOCHASTIC MODELS IN STUDIES OF ALLUVIAL CHANNEL PROCESSES,
W69-00937 02J

ESTIMATING EVAPOTRANSPIRATION IN A HUMID REGION,
W69-00939 02D

LYSIMETER AND WATERSHED EVAPOTRANSPIRATION,
W69-01054 02D

STEADY FLOW
STEADY AND UNSTEADY EFFECTS ON DISCHARGE IN A RIVER CONNECTING TWO RESERVOIRS.
W69-01137 02E

STOCHASTIC PROCESSES
THE USE OF STOCHASTIC MODELS IN STUDIES OF ALLUVIAL CHANNEL PROCESSES,
W69-00937 02J

STOMATA
DIFFUSION THROUGH MULTIPERFORATE SEPTA,
W69-00988 02D

STORAGE CAPACITY
STORAGE REQUIREMENTS FOR WATER IN THE UNITED STATES,
W69-01073 06D

STORAGE REQUIREMENTS
STORAGE REQUIREMENTS FOR WATER IN THE UNITED STATES,
W69-01073 06D

STORET
STORAGE AND RETRIEVAL OF DATA FOR WATER QUALITY CONTROL.
W69-01126 07C

STORM DRAINS
DAY V MUMMEY (STORM DRAINS).
W69-00830 06E

HUNN V HORVITZ CO (INJUNCTION AGAINST STORM SEWER MAINTENANCE).
W69-00864 04C

STORMS
TIME DISTRIBUTION OF RAINFALL IN HEAVY STORMS,
W69-01045 02B

STRATIFICATION
MANIPULATION OF RESERVOIR WATER FOR IMPROVED QUALITY AND FISH POPULATION RESPONSE,
W69-01170 05C

STREAM EROSION
RATE OF SOLUTION OF LIMESTONE IN THE KARST TERRANE OF FLORIDA,
W69-00997 02J

COMPUTATION OF THE GREATEST POSSIBLE DEPTH OF CHANNEL DEGRADATION,
W69-01033 02J

STREAMBEDS
A TECHNIQUE TO DETERMINE EVAPORATION FROM DRY STREAM BEDS,
W69-01026 02D

OCCURRENCE OF POOLS AND RIFFLES AN ELEMENT IN THE QUASI-EQUILIBRIUM STATE OF RIVER CHANNELS,
W69-01166 02J

STREAMFLOW
RECESSION CHARACTERISTICS OF IOWA STREAMS PART I - TEMPORAL AND AREAL DISTRIBUTION OF RECESSION CONSTANTS,
W69-00718 02E

THE EFFECTS OF VARYING LAND AND WATER USE ON STREAMFLOW REGIMEN.
W69-01130 06D

STEADY AND UNSTEADY EFFECTS ON DISCHARGE IN A RIVER CONNECTING TWO RESERVOIRS.
W69-01137 02E

STREAMFLOW FORECASTING
RECESSION CHARACTERISTICS OF IOWA STREAMS PART I - TEMPORAL AND AREAL DISTRIBUTION OF RECESSION CONSTANTS,
W69-00718 02E

STREAMS
RECESSION CHARACTERISTICS OF IOWA STREAMS PART I - TEMPORAL AND AREAL DISTRIBUTION OF RECESSION CONSTANTS,

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 2, NUMBER 4
FEBRUARY 15, 1969

MAY -2 1969

WR 69-01206 -- WR 69-01593

NEW SERIES

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign); single copy price is $3.00.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

LIBRARY U. OF I. URBANA - CHAMPAIGN

VOLUME 2, NUMBER 4
FEBRUARY 15, 1969

WR 69-01206 -- WR 69-01593

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States--now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

LIBRARY U. OF I. URBANA - CHAMPAIGN

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY OF THE UNIVERSITY OF ILLINOIS - URBANA

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

02. WATER CYCLE

2A. General

AN INVESTIGATION INTO THE RELATIONSHIP BETWEEN METEOROLOGICAL VARIABLES AND STREAMFLOW.
Rutgers University, New Brunswick, N. J. College of Agriculture and Environmental Science.
Joseph L. Horowitz, and Mark D. Shulman.
Water Resour Bull, AWRA, Vol 3, No 3, pp 21-31, Sept 1967. 11 p, 6 fig, 3 tab, 4 ref. OWRR Project A-002-NJ.

Descriptors: *Synthetic hydrology, Streamflow, Runoff, New Jersey, Statistical models, Low flow, Base flow, Drought.
Identifiers: *Thornthwaite method.

Analyses are presented relating streamflow and meteorological variables. In one approach a physical model was developed and yielded a correlation coefficient of .857 between streamflow and Thornthwaite runoff. The resulting linear regression equation had a standard error of 37.10 cfs and could be used to develop a synthetic streamflow sequence with best results during low flow situations. A second approach used a linear stepwise multiple regression analysis to relate streamflow and monthly values of antecedent precipitation and Palmer runoff. This model yielded an equation with six predictors and a multiple correlation coefficient of .877 and a standard error of 35.21 cfs. The first approach is preferred in that the comparative loss in the reduction of variance is outweighed by the simplicity of the method. (Shulman-Rutgers)
W69-01249

ANALYSIS OF OVERLAND FLOW ON SHORT EROSION PLOTS,
Purdue Univ, Lafayette, Indiana.
George R. Foster.
Part of OWRR Project B-003-IND: 'Mathematical Simulation of Hydrologic Events on ungaged Watersheds', 1968. Master of Science Thesis, Department of Agricultural Engineering, Purdue University, 1968. 138 p, 43 fig, 5 tab, 4 append.

Descriptors: *Erosion, *Sedimentation, *Overland flow, Runoff, Reynolds number, Chezy equation, Retention storage, Infiltration, Manning's equation, Roughness, Surface profiles, *Agricultural watersheds, Runoff coefficient, Hydrograph analysis.
Identifiers: Coefficient of friction.

An analytical overland flow model of a watershed runoff hydrograph is proposed that satisfactorily predicts runoff for short agricultural slopes. The developed model is a kinematic model that mathematically is the combination of the continuity equation and the Chezy uniform flow relationship. The model includes retention storage, provisions for a variable point infiltration rate and a variable coefficient of friction, the 'drying up' of the upstream end of the slope during recession and a variable area infiltration rate that is a function of the water surface area during recession. An implicit finite difference scheme is used to evaluate the continuity equation, and the model is programmed in FORTRAN IV for numerical evaluation on a digital computer. Field hydrographs from fallow erosion study plots were analyzed for retention storage and predicted coefficients of friction. These results were used in the model to simulate hydrographs which were compared with field hydrographs to test concepts used in the model. The model with a constant coefficient of friction or Manning's 'n' adequately describe overland flow on short agricultural slopes. (Author)

W69-01443

AN EVALUATION OF THE INFLOW-RUNOFF RELATIONSHIPS IN HYDROLOGIC STUDIES,
J. Amorocho, and G. T. Orlob.
Univ. Calif, Wat Resour Center Contrib No 41, 1961. 70 pp.

Descriptors: *Rainfall-runoff relationships, *Model studies.

Studies have been carried out by the University of California to establish some of the criteria required for the interpretation of statistical analyses of the relation between rainfall and run-off. For this purpose, a model of an hydrological unit was developed, based on a qualitative analysis of its fundamental functional elements, and its structure was compared with that of a typical regression equation. The conditions for minimum error in the estimates of flow from catchments were examined and various watersheds in different parts of the world were investigated to test the applicability of the equations of state developed. The advantages of using an equation of state for hydrologic studies in preference to wholly empirical relations derived from more or less arbitrary multiple correlation analyses are indicated.
W69-01555

STEPS TOWARD A BETTER UNDERSTANDING OF URBAN RUNOFF PROCESSES,
E. F. Brater.
Water Resources Res, Vol 4, No 2, p 335, April 1968.

Descriptors: *Rainfall-runoff relationships, Drainage systems, Surface runoff, *Storm runoff, Groundwater.

Rainfall and runoff from drainage basins in various stages of urbanization were analyzed to determine the initial retention, the hydrologically significant impermeable area, and the infiltration capacities of the permeable portions of the basins. The drainage basins, varying in size from 9.5 to 185 square miles, are located in the Detroit metropolitan area. Techniques were developed that largely eliminated personal judgment in separating surface runoff from ground water discharge. Infiltration capacities in this region are from 3 to 5 times higher in late summer than in early spring. The average initial retention for the basins studied is approximately 0.2 inch. The hydrologically significant impermeable area appears to be closely related to the population density, but the effect of other factors is being studied. An investigation of the cause of seasonal and short period variations of infiltration capacity may provide a better understanding of the infiltration process.
W69-01563

COMPUTATION OF OPTIMUM REALIZABLE UNIT HYDROGRAPHS,
Peter S. Eagleson, Ricardo Mejia-R, and Frederic March.
Water Resources Res, Vol 2, No 4, pp 755-764, 1966. 6 fig, 22 ref.

Descriptors: *Rainfall-runoff relationships, *Computer programs.
Identifiers: Calculations, *Urban hydrology.

The Wiener-Hopf theory of optimum linear systems is applied to the determination of the stable pulse response of a monotone hydrologic system from coincident records of input and output in the form of discrete time series. In application to the rainfall-runoff system, linear programming methods are used in the solution of the Wiener-Hopf equations to obtain physically realizable unit hydrographs. An actual urban rainfall-runoff event is graphed and used for illustration in developing the equation.
W69-01567

SCALE MODEL OF URBAN RUNOFF FROM STORM RAINFALL,
R. A. Grace, and P. S. Eagleson.
ASCE Proc, J Hydraulics Div, Vol 93, No HY3, pp 161-176, May 1967.

Descriptors: Storms, *Model studies, Storm runoff.
Identifiers: *Urban drainage.

The response of a small urban watershed to four storms is generated in the laboratory by a scale model consisting of a programmed rainfall generator, vertically-distorted scaled topography, and a weighing device for recording the cumulative runoff. Comparison of these results with prototype measurements through use of derived scaling laws shows reasonable agreement.
W69-01570

ON STRUCTURE OF COAXIAL GRAPHICAL RAINFALL-RUNOFF RELATIONS,
A. Becker.
Int. Assn Sci Hydrology-Bul, Vol 11, No 2, pp 121-30, June 1966.

Descriptors: *Rainfall-runoff relationships, *Rainfall intensity.

This paper, supported by investigations into extreme conditions and events--i.e., moisture-oversaturated river basin, threshold concept, instantaneous rainfall and rainfall of extreme amount--supplies general information on structure of coaxial graphical rainfall-runoff relations and on physical laws primarily controlling shape of curves in individual quadrants of coaxial relations.
W69-01575

CONCEPTION OF A MODEL FOR DETERMINING THE LAWS OF RAIN DISCHARGE RELATIONS ,
A. Becker.
Wasserwirtsch-Wassertech, Vol 18, No 1, pp 16-21, Jan 1968.

Descriptors: *Model studies, *Rainfall-runoff relationships, Flow measurement, *Surface runoff, Runoff forecasting.

Rain discharge relations, especially on the surface of rivers, play a significant role in the forecasting of floods, because they make it possible to achieve a maximum time advance in making the forecasts. A model is developed (based on unit territorial and rain relations) to deduce the rain discharge relationships from threshold values and other simple quantities. An example is given for which - on the basis of favorable conditions - an approximate determination of the surface water retention was possible by considering the surface water states at two representative measuring stations.
W69-01576

SURVEY OF RECENT DEVELOPMENTS IN RAINFALL-RUNOFF ESTIMATION,
F. C. Bell.
Instn Engrs, Australia-J, Vol 38, No 3, pp 37-47, March 1966.

Descriptors: Rainfall intensity, *Computer programs, *Rainfall-runoff relationships, *Model studies.

Advances in estimating streamflow from given quantities of rainfall that were made by simulating hydrological phenomena with high-speed computers are surveyed; it is shown that some of these techniques are based on rather artificial models of physical processes and could give poor predictions for extreme or uncommon conditions; individual processes are studied and it is suggested that most models could be improved.
W69-01577

A MATHEMATICAL MODEL FOR RELATING RUN-OFF TO RAINFALL WITH DAILY DATA,
W. C. Boughton.
Civ Eng Trans, Inst Engrs Australia, Vol CE8, No 1, pp 83-97, 1966.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: *Model studies, *Rainfall-runoff relationships, Rain gages.

The author describes the development and use of a mathematical model to simulate the changes of moisture in a catchment using daily rainfalls and evaporation records as data; the principal physical processes reproduced in the model, namely, evapotranspiration losses, soil moisture storage, and infiltration losses, are discussed. The model has been used with records from 6 gauged catchments in New South Wales, and showed reasonable correlation between recorded and estimated run-offs; the results also suggested a possible explanation of the difference in infiltration rates between plot experiments and natural catchments.
W69-01579

RAINFALL-RUN-OFF RELATIONS IN THE UPPER GOULBURN RIVER CATCHMENT, N.S.W.,
T. G. Chapman.
Civ Eng Trans, Inst Engrs, Vol CE5, pp 25-35, Aug 1963.

Descriptors: *Rainfall-runoff relationships, *Rain gages, *Storm runoff, *Groundwater recharge, *Rainfall intensity.
Identifiers: *Calculations.

The author describes the methods developed to determine the relation between rainfall and run-off in the Upper Goulburn river catchment in New South Wales, a large catchment for which records of stream flow and daily rainfall were available but there were no data on rainfall intensity. The network of official rain gauges was supplemented by records from privately-operated instruments; these had a slightly lower standard of consistency but were of adequate quality for use in the analysis. Linear regression techniques were used to estimate mean winter and summer rainfalls for each station for a common 50-year period; isohyetal maps for mean seasonal rainfalls were then developed by correlating the estimated rainfall for each station with its altitude and a third variable dependent on topography or location. About 75 per cent of the variation in rainfall was accounted for in this way, compared with 37 per cent when altitude was the only variable. The stream-flow record was used to estimate, within wide limits, the mean annual recharge to ground water and to calculate the direct run-off from 242 storms in 47 years. The relation between rainfall and run-off was developed by multiple regression analysis, which was first used to compare the efficiency of different predictors of rainfall intensity and catchment dryness.
W69-01583

LABORATORY STUDY OF WATERSHED HYDROLOGY,
V. T. Chow.
Paper, Int Hydrol Symp, Fort Collins, Colo, Sept 1967, U of Illinois, Urbana. 14 p, 3 fig, 7 ref.

Descriptors: *Rainfall-runoff relationships, *Watersheds, *Storm runoff, *Model studies, *Computer programs, *Roughness (Hydraulic), Discharge (Water).

A conventional approach to study the rainfall-runoff relationship of a watershed uses historical hydrologic data to fit a black-box model for simulation of watershed hydrologic behavior. Although many measurements of rainfall input and runoff output from watersheds are available, no general theory explaining the course of flow mechanics from input to output exists. The proposed laboratory approach investigates basic laws and principles controlling mechanics of runoff from a watershed. It employs a watershed experimentation system (WES) as a tool for the research. The WES is an instrumentation system of integrated hydraulic, electronic, and structural design that can produce an artificial rainfall of variable time and space distribution to move over a laboratory area of 40 by 40 ft or less; thus, it is capable of simulating a storm moving in any direction over a testing drainage basin constructed within the area. The experiment is controlled electronically by a digital computer, and output runoff is measured by sonar detectors which transmit information to the computer for immediate recording and analysis. Various problems being studied include the time factor in runoff process, conceptual watershed roughness, and effect of storm movement on peak discharges. The WES also may be used to study subsurface runoff by employing testing basins made of porous materials.
W69-01584

SEQUENTIAL GENERATION OF RAINFALL AND RUNOFF DATA,
V. T. Chow, and S. Ramaseshan.
ASCE Proc, J Hydr Div, Vol 91, No HY 4, Pt 1, paper 4416, pp 205-23, July 1965.

Descriptors: *Storm runoff, *Drainage systems, *Rainfall-runoff relationships.
Identifiers: *Calculations.

Practical procedure is demonstrated by applying sequential generation techniques to rainfall and runoff data for stochastic, hydrological analysis of drainage basin systems; in this method, stochastic process is formulated by several major components including hourly annual storm rainfalls, abstractions, routing model, baseflow, direct runoff, and total runoff: 1000 annual storms are generated sequentially by Monte Carlo methods and then routed through simulated basin system to produce 1000 generated floods which are represented by stochastic flow-duration curves for use in water resources planning and design.
W69-01585

CONCEPTUAL MODEL OF HYDROLOGIC CYCLE,
N. H. Crawford, and R. K. Linsley.
Int Geodetic and Geophysical Union-Soc for Sci Hydrology Pub, No 63, pp 573-87, 1964.

Descriptors: *Model studies, *Watersheds, *Hydrographs, Groundwater, *Storm runoff, Rainfall-runoff relationships, *Computer programs.

Model called Stanford Watershed Model (Mark II) utilizes hourly ordinates of hydrograph during and immediately after rain and mean daily ordinates for interim periods; print-out includes monthly and annual flow, monthly groundwater runoff, end of month soil moisture, and flow duration curve of daily runoff; model includes among its components surface, interflow, and groundwater runoff; model has been tested on basins embracing variety of climate, hydrologic, and geologic conditions.
W69-01586

LIMITING FACTORS IN RAINFALL RUN-OFF,
L. B. Escritt.
Engr, London, Vol 213, 1962.

Descriptors: *Rainfall-runoff relationships, *Storm runoff, Storms, *Rainfall intensity, Design, Sewage treatment, *Runoff forecasting.
Identifiers: *Surface permeability.

When sewerage systems are being designed, the volume of storm water is often over-estimated because no allowance is made for change of impermeability during rainfall. In addition, in large catchment areas, heavy storms frequently cover only part of the total catchment, and when run-off is calculated by relating statistics of frequency, intensity and duration of rainfall to impermeable area by a time-of-concentration method, the flow may be considerably over-estimated. The author suggests methods for allowing for the change of impermeability during rainfall and for assessing the maximum areas likely to be covered by storms.
W69-01589

RAINFALLS OF SHORT DURATION AND HIGH INTENSITY: AN ALTERNATIVE TO BILHAM'S FORMULA,
L. B. Escritt.
Water Waste Treatment J, Vol 7, 1960.

Descriptors: *Rainfall intensity, Design, *Surface runoff, *Sewers.
Identifiers: *Storm sewers.

In connection with the design of surface water sewers, the author discusses the use of Bilham's formula for rainfalls of short duration and high intensity, and presents a modified general intensity formula derived from logarithmic plotting based on Bilham's formula.
W69-01590

COMPUTING RUNOFF FROM SMALL WATERSHEDS,
C. L. Hamilton.
Pub Works, Vol 96, No 8, pp 106-8, Aug 1965.

Descriptors: *Storm runoff, *Rainfall intensity, Watersheds.
Identifiers: *Calculations.

Use of summation 'W' method for estimating runoff from small watersheds, with 'W' standing for relative valves of certain physical watershed characteristics that are summed up to obtain preliminary estimate of peak discharge; rainfall factor was developed to make adjustment in rainfall intensity as it varies throughout United States in reference to intensity chosen as standard; sample computation is presented to illustrate application of method; data on runoff-producing characteristics of watershed with corresponding weights.
W69-01593

2B. Precipitation

CALIFORNIA HIGH WATER, 1965-1966.

California, Dept Water Resources-Bul 66-69, Aug 1967. 61 p.

Descriptors: Rainfall-runoff relationships, Precipitation intensity, *Storm runoff, Storms.
Identifiers: California.

This report provides information on meteorology, rainfall-runoff, and damages resulting from major storms of 1965-66 water year; it describes general weather patterns preceding and during storm periods, including precipitation characteristics and discusses resulting runoff in seven hydrograph areas of state; it presents information on flooded areas and damages; two storms during Nov 1965 recorded total of 30 in. of precipitation and one day maximum of 12.4 in. at station in Santa Ana River Basin.
W69-01498

TIME ANALYSIS OF RAINFALL ON URBAN CATCHMENT,
V. J. Bidwell.
J Hydrology, New Zealand, Vol 6, No 2, pp 74-9 1967.

Descriptors: *Rainfall intensity, *Computer programs, Rain gages.
Identifiers: *Urban drainage, *New Zealand.

Analysis of short-time-increment rainfall at University of Auckland in New Zealand; autocorrelation techniques proposed by R. A. Grace and P. S. Eagleson were used; practical methods of data recording and processing, suitable for digital computer analysis, are outlined; autocorrelation results are given for 1 yr of 10-min rainfall values for Albert Park gage at Auckland.
W69-01561

RELATION OF ANNUAL RUNOFF TO METEOROLOGICAL FACTORS,
M. W. Busby.
U S Geol Survey-Prof Paper 501-C, p C188-9, 1964.

Descriptors: Runoff, *Runoff forecasting, Rainfall-runoff relationships.

Average annual runoff at 62 selected stations throughout conterminous United States was related to nine meteorological factors as recorded at U S Weather Bureau first-order weather station near each point of runoff study; seven of these factors were significant at 80% level or higher; on basis of these seven factors, standard error of estimate of average annual runoff is about 30%.
W69-01582

2C. Snow, Ice, AND Frost

EFFECT OF SNOW COMPACTION ON RUNOFF FROM RAIN OR SNOW,
F. A. Bertle.
U S Bur Reclamation-Eng Monographs, No 35, June 1966. 45 p.

Descriptors: *Runoff, *Snowmelt, Design storm, *Rain.

Computational procedure for determining water available for runoff and its time of occurrence resulting from rain-on-fresh-snow condition; procedure includes estimate of shrinkage of snow pack caused by metamorphosis of crystalline structure with addition of rainfall; examples are given showing use of procedure with assumed design storm conditions; procedure is used to reproduce observed flood which verifies accuracy of method and assumptions and is intended for use in inflow design flood study in which design rain occurs on fresh snowpack.
W69-01578

DETERMINATION OF THE MELT-WATER FLOW FROM THE WATER RESOURCES OF THE SNOW COVER,
H. J. Grasnick.
Wasserwirtsch-Wassertech, Vol 17, No 9, pp 302-306, Sept 1967.

Descriptors: *Snowmelt, *Runoff.
Identifiers: *Calculations.

With the aid of several statistical methods, an attempt was made to work out a prognosis for the melt-water run-off (as well as the total run-off at peak values) in some river areas of the German Democratic Republic showing various physical and geographical conditions. The investigation made use only of observation data published in the meteorological and hydrological annuals. Although this material, especially that about the snow cover, did not permit the desired fully complex statistical evaluation, nevertheless, it was possible to find certain regularities in the relationship between the water resource and run-off. The report contains results of a differential analysis of special snow investigations carried out in Spring 1965 and the author's suggestions on how to improve observation of the snow cover.
W69-01592

2D. Evaporation and Transpiration

WATER REQUIREMENTS FOR INCREASED ARID LAND PRODUCTIVITY,
George H. Hargreaves.
Agency for International Development; Centro Interamericano de Desarrollo Integral de Aguas y Tierras, Project 213, Bogota, Colombia.

Descriptors: *Water requirements, *Arid lands, *Precipitation (Atmospheric), Evaporation, *Evapotranspiration, Moisture availability, Meteorological data, Consumptive use, Productivity, Evaporation pans, Equations, Rainfall disposition, *Climatic data.
Identifiers: Formulas, Moisture index.

Measured or computed evaporation and potential evapotranspiration, when combined with rainfall and effective precipitation, provided a valuable and useful index of moisture needs or deficiencies for forage or crop production in arid climates. Formulas were presented for computing evaporation from climatic data. Evaporation can be calculated from temperature data alone. Production was probably directly related to the degree to which the potential evapotranspiration or consumptive use requirements were supplied by available moisture. Methods for improving moisture availability were listed and described. The ratio of effective precipitation to potential evapotranspiration Pe/Etp was proposed as a useful and valid index for the classification of climate. (Blecker-Ariz)
W69-01470

2E. Streamflow and Runoff

UNSTABLE MISCIBLE FLOW IN HETEROGENEOUS SYSTEMS,
California University, Los Angeles.
R. L. Perrine, and G. M. Gay.
2d Preprint, Symp, 58th Nat Meeting, Amer Inst Chem Eng, New York, NY, Feb 1966. 35 p, 8 fig, 2 tab, 6 ref, append.

Descriptors: Numerical analysis, Flow, *Heterogeneity, Porous media, Mathematical models, *Computer models, Analytical techniques, Oil reservoirs, Dispersion, Approximation method, Flow characteristics, Three-dimensional.
Identifiers: *Flow instability, Miscible displacement, Linearized, Perturbation method.

Amethod is described of numerical computation for three-dimensional unstable miscible displacement behavior useful for heterogeneous systems, as well as under more ideal conditions. Flow equations are first linearized by a perturbation approach. The basic flow is separated and a solution for its behavior readily obtained. The remaining problem of deviations from the basic flow caused by nonideal conditions is subjected to numerical analysis. Results obtained from the method are presented. The following conclusions have been drawn: although the conditions assumed in test calculations have been severe, results obtained show the dispersing flow expected, and appear satisfactory. The method eliminated or reduced in importance problems of oscillating values near steep fronts and excessive computer smoothing. An unique advantage of the method is that one can see the source of variations from ideal behavior. One serious drawback results from the algebraic complexity of the perturbation approach, and the need for second order terms to be retained in calculations of interest. Fewer array points are available and more computer time is required than would be desired. These difficulties also are experienced with other approaches to the solution of three-dimensional displacement problems.
W69-01247

HYDRAULIC MODEL OF RUNOFF FROM DEPRESSIONAL AREAS,
Kentucky Univ., Lexington; Iowa State Univ., Ames.
For primary bibliographic entry see Field 06A.
For abstract, see .
W69-01436

A DYNAMIC SIMULATION OF THE LOWER KANSAS RIVER DRAINAGE SYSTEM,
Federal Water Pollution Control Administration, Atlanta, Ga; University of Kansas, Lawrence.
Albert R. LeFeuvre, and Ernest C. Pogge.
Amer Soc Civ Eng, Hydraul Div 16th Annu Spec Conf, Massachusetts Inst of Technol, Cambridge, Aug 1968. 41 p, 14 fig, 2 tab, 8 ref, disc, append.

Descriptors: *Drainage basins, *Watersheds, *Simulation, Hydrographs, Outflows, Hydrometeorological station, *Models, Discharges, Reservoirs, Rivers, Dynamics, Hydrology, Runoff, Streamflow, Streamflow forecasting, Computer programming.
Identifiers: *Hydrologic models, *Lower Kansas Riv Valy (Kans), *Kansas River Basin, *Model studies, *Mathematical models, Gaging stations.

A digital computer was used to simulate dynamic response of the Lower Kansas River Drainage System to unsteady hydrologic inputs. The model accounts for local inflow and upstream conditions. Boundary conditions for the model were the average daily flow hydrographs observed at 20 tributary stream gages. The hydrology of the river system was incorporated into a water quality model that simulated the distribution of conservative and nonconservative pollutants throughout the drainage system. Only the flow simulation is discussed. The model was verified by comparing machine-generated hydrographs for 5 mainstem stream gages with the corresponding observed hydrographs. Six time periods of approximately 40 days each are presented as verification of the model. (USBR)
W69-01468

HYDRAULICS RESEARCH 1963 AND 1964. THE REPORTS OF THE HYDRAULICS RESEARCH BOARD WITH THE REPORTS OF THE DIRECTOR OF HYDRAULICS RESEARCH.

Department of Sci and Ind Res and the Ministry of Tech, 1964 and 1965, 84 pp and 96 pp.

Descriptors: *Hydraulics, *Runoff, *Drainage, *Pipes, *Storm runoff, Estuaries, Model studies, Sewage effluents.
Identifiers: Surface permeability, *Combined sewers.

Hydrological studies reported include: the factors affecting run-off in a permeable (chalk) catchment area and stream flow in an impermeable catchment; the effect of afforestation on the water balance of a catchment area; and lysimeter experiments on factors affecting evapotranspiration and drainage. Studies have continued on the attenuation of flood waves in partly-filled pipes, including tests on the mixing of an incoming surge of relatively clean storm sewage with the grossly polluted sewage in a combined sewage system. Studies on estuaries and tidal flow, carried out both in models and in the field, have included the problems of silting, dispersal and recirculation of heated effluents discharged from power stations, and dispersal of sewage effluents from outfalls, including flume tests on dispersion in steady turbulent flow.

THE USE OF UNIT-SOURCE WATERSHED DATA FOR RUN-OFF PREDICTION,
C. R. Amerman.
Wat Resour Res, Vol 1, pp 499-507, 1965.

Descriptors: *Runoff forecasting, *Demonstration watersheds, Subsurface runoff, Storms.

Run-off from 10 units forming a 76-acre complex watershed and from 2 units forming a 7.4-acre complex watershed in the North Appalachian experimental watershed near Coshocton, Ohio, was measured during storms during 1956. The partial run-off values were used to calculate a theoretical value for the run-off from each complex watershed, which was compared with the observed run-off. For the 76-acre watershed, the observed run-off was very much larger than the estimated run-off for small storms, but the two values approached as the storm size increased; in the case of the 7.4-acre

LIBRARY U. OF I. URBANA - CHAMPAIGN

watershed the estimated value was very much larger than the observed run-off for small storms and almost equal to it for large storms. In order to produce a better model for this type of calculation it was concluded that the question of sub-surface run-off, partial area flow, and the influence of run-off from the upper slopes on that from lower areas, should be considered.

ASCE RESEARCH PROGRAM IN URBAN WATER RESOURCES.
Civ Eng, Vol 38, No 5, pp 70-71, May 1968.

Descriptors: Data collections, *Design, *Storm drainage, Instrumentation, *Rainfall-runoff relationships, *Water quality, Model studies, Drainage systems.
Identifiers: *Urban drainage, *Urban hydrology.

The ASCE Urban Hydrology Research Council has initiated a program to study and report on research and data needs for urban-water problems. The program currently consists of two major projects: Research and Analysis of National Basic Information Needs in Urban Hydrology and Systematic Study and Development of Long-Range Programs of Urban Water Resources Research. Under the first project an intensive study is being made of the types of data needed for improved design of storm-drainage facilities, including both quantity and quality of drainage-flow needs for data-collecting instrumentation; and for approval of types of networks necessary to collect adequate data. The ultimate objective is to facilitate transfer of data findings between metropolitan regions. The second project will attempt to provide guidelines for initiating and expanding a program of long-range studies on urban water problems. This includes: prefeasibility studies to determine the possible effectiveness, cost and time requirements for a comprehensive systems-engineering analysis of all aspects of urban water and for a general economic analysis of costs and pricing parameters of all aspects of urban water; a state-of-the-art study of mathematical models and related techniques for analyzing urban rainfall-runoff-quality processes; a study of requirements for the assessment of drainage damage and exploration of alternatives to direct storm-water runoff; and a study of political, economic, legal, and social problems related to urban water management.

SOLUTION TO SURFACE RUNOFF PROBLEM,
A. Y. Abdel-Razaq, W. Viessman, Jr., and J. W. Hernandez.
ASCE Proc, J Hydraulics Div, Vol 93, No HY6, Paper 5606, pp 335-52, Nov 1967.

Descriptors: *Hydrographs, Runoff, Surface runoff.

Surface runoff hydrographs are computed by relatively simple method consisting of reducing governing partial differential equations to ordinary differential equations at several nodal points along flow plane; these equations are then solved for time derivatives which are used in Taylor's series to approximate velocity and depth after increment in time; comparison with experimental data shows that runoff hydrographs were reproduced fairly accurately; numerical solution was shown to be stable and truncation errors negligible.

PROBLEMS OF HYDROLOGICAL FORECASTS.
Studii Hidrol, Inst Studii Cerc Hidroteh, Vol 13, 1965. 208 pp, 2 tab.

Descriptors: *Runoff forecasting, *Hydrographs, Discharge (Water).
Identifiers: Roumania.

This publication contains the full text of 5 papers on the prediction of run-off and stream flow with special reference to conditions in Roumania. Aspects considered include the short-range forecasting of run-off by the trend method; forecasting of hydrographs of floods caused by precipitation, using the isochrones method; forecasting of mean discharges in the Danube over periods of 10 and 5 years, based on the water resources in the drainage area; short-range forecasting of discharges in the rivers Somes, Mures, Jiu, Olt, and Siret, based on water resources in the drainage area; and short-range forecasting of freezing and the breaking-up of ice on Roumanian rivers.

RESEARCH REPORT OF THE CITY AND GUILDS COLLEGE, 1961-64.
Imperial College of Science and Technology, (University of London).

110p.

Descriptors: *Rainfall-runoff relationships, Computer programs, Model studies.
Identifiers: *Calculations.

This report includes sections on engineering hydrology (pp. 53-54) and public health engineering (p. 54). Studies on surface waters have included the flood response of a river to rainfall, propagation of a flood wave along a river, mechanism of run-off from an artificial catchment receiving 'rain' from a sprinkler, design of a network of hydrometric stations, and the use of modern techniques, including digital and analogue computers, to analyse hydrological data and investigate the relations between rainfall and run-off. A mathematical study was made of the flow of irrigation and rain water to horizontal tube drains, and the mathematics of diffusion were applied to the description of unsteady flow of ground water. Studies were also made on the relation between hydrology and water demand, particularly for irrigation, and on the management and planning of water resources, including the design and operation of storage reservoirs. In connexion with water and sewage treatment, model and prototype studies were made on the mixing characteristics of horizontal-flow sedimentation tanks, and work on mixed-bed filtration led to the development of an efficient graded filter with layers of polystyrene, anthracite, sand and garnet, the strata being graded so that they retain their relative positions during back-washing and so that the pore space decreases in the direction of flow, with consequent deeper penetration of removable material.

A TECHNIQUE FOR ANALYSIS OF RUN-OFF HYDROGRAPHS,
D. L. Brakensiek.
J Hydrol, Vol 5, pp 21-32, 1967.

Descriptors: *Hydrographs, *Runoff, *Computer programs.

A single function, based on a transformation of the Pearson type III equation, was used to fit simple hydrographs, provision being made for the independent evaluation of discharges for the rising and falling limbs. Fitting principles, including those for computer use, are discussed and detailed, and a Fortran II source programme written for an IBM 1620 computer is listed. Using an on-line plotter, calculated hydrograph points were compared visually with observed curves.
W69-01580

UNIT GRAPHS FOR NONUNIFORM RAINFALL DISTRIBUTION,
J. A. Buil.
ASCE-PROC, J Hydraulics Div, Vol 94, No HY1 paper 5762, pp 235-57, Jan 1968.

Descriptors: Drainage, *Runoff, *Hydrographs.

Correlation between Snyder's basin constants C and 640 Cp and basin physical characteristics o drainage area, total length, average slope length t center of area, and elongation is established usin synthetic data; actual data are used to compensat for discrepancies introduced through initial use o synthetic data; effects of nonuniform rainfall dis tribution on basin runoff hydrographs represented by unit graph, selected from thre computed for each basin; computation formula are presented to define each of three basin uni graphs; dimensionless unit graph is introduced fo more accurate definition of rising and falling link of each unit graph.
W69-01581

DISCHARGE FROM HEAVY RAINFALL,
E. E. Dawson.
Proc Inst Civ Engrs, Vol 25, pp 373-374, 1963.

Descriptors: *Discharge (Water), *Rainfall-runo relationships.

In connexion with previous work on discharge fro heavy rainfall, further studies have shown that n serious error was introduced by treating the flow uniform (whereas the flow on the ideal catchme would be non-uniform) provided that th catchment was not very small.

STORAGE OF FRESH WATER IN UN DERGROUND RESERVOIRS CONTAININ SALINE WATER: PHASE I,
Kansas University, Lawrence.
Don W. Green, and Ronald L. Cox.
Kansas Water Resour Res Inst Rep, Kansas Sta Univ, Manhattan, Aug 1966. 96 p, 8 fig, 1 tab, chart, 28 ref, 4 append. OWRR Project B-003-Ka

Descriptors: Diffusivity, Groundwater recharg Recharge wells, Saline water intrusion, U derground storage, Dispersion, Gravity studie Computer models, Computer programs, Math matical models, Saline water-freshwater interface Groundwater movement.

A computer model has been developed for applic tion to salt water-fresh water displaceme processes in porous media. It is based on the n merical method of characteristics as presented Garder, Peaceman, and Pozzi. The model is tw dimensional, allows for dispersion or mixing of t fluid-fluid interface, and accounts for fluid densi differences. Porous-media properties are held co stant. The details of the computer program inclu ing a listing are included in this report. Several c culations were made with the model approximati laboratory-scale displacement experiments and actual field underground fresh water storage te These calculations indicate the potential usefuln of the mathematical model.

INDUCED ELECTRICAL POLARIZATION AN GROUNDWATER,
California University, Berkeley.
Rene Bodmer.
OWRR Project B-002-CAL, Rep No MT 67-1, G of Eng, Mar 1967. 101 p, 43 fig, 21 ref, 3 append

Descriptors: *Groundwater, Groundwa recharge, Resistivity, Clays, Geophysics, Electri studies, Gravels, Exploration, *Aquifers, Electri properties, Electric currents, Polarization, Elec cal impedance, Electric potential, Measuring struments, Subsurface investigations.
Identifiers: *Electrical prospecting, *Induc polarization method, Geophysical prospecting.

Conventional induced electrical polarization equipment was evaluated for investigating natural ground-water reservoirs in unconsolidated sediments. Clay horizons and other clay-bearing unconsolidated sediments are potential sources of induced polarization anomalies. Magnitudes of these anomalies are not expected to be large. However, if such anomalies may be detected above system noise, then the induced polarization method may be of value for in situ classification of unconsolidated sediments encountered in hydrological projects. One such project exists in Santa Clara County to determine whether or not induced polarization methods might be of value in potential recharge areas. Of 4 areas, only 2 yielded significant frequency effect anomalies and in each of these 2 the frequency effects were of order 3%. These anomalous frequency effects may be related to clayey gravels. The dipole-dipole array with spreads of 10 to 20 ft was typically used in the study.

BAND DIFFUSION WITH VARIABLE PARAMETERS ALONG FLOW,
Syracuse University, New York.
Wen-Hsiung Li.
J Eng Mech Div, Amer Soc Civ Eng, Proc Pap 4106, Vol 90, No EM5, pp 343-361, Oct 1964. 19 p, 8 fig, 14 ref, append.

Descriptors: *Dispersion, Flow, Porous media, Groundwater, Wastes, *Uniform flow, *Diffusion, Porous materials, *Engineering mechanics.

The diffusion equation with variable parameters along the flow can be solved when the diffused quantity is confined to a narrow band. Solutions are obtained for diffusion from a line source and a point source in nonuniform flows. The dispersion of a contaminant in nonuniform flows through porous media is studied. It is found that the dispersion across the streamlines can be estimated by using the solutions of diffusion from a line source and a point source in a uniform flow. (S. Mayer-FWPCA)

DISTRIBUTION AND OCCURRENCE OF NEW MEXICO'S THERMAL WATERS--A STATISTICAL SUMMARY,
New Mexico Institute of Mining and Technology State Bureau of Mines and Mineral Resources, Socorro.
W. K. Summers.
Tech Pap, 20th Annu Meeting New Mexico Geol Soc, Roswell, May 1966. 9 p.

Descriptors: *Thermal water, *Thermal springs, Groundwater, *Warm springs, Chemical analysis, Temperature, Aquifers, pH, Igneous rocks, Geothermal studies, *New Mexico.

Of 67 areas in New Mexico reported to discharge ground water at temperatures of 90 deg or higher, 46 have been substantiated in the field, 10 do not exist at the locations reported or have lesser temperatures. Data for 46 areas that have been field checked show that (1) thermal waters occur in the western half of the State, primarily in Rio Grande and Gila-San Francisco drainage basins; (2) only 16 areas have been discovered by wells whereas 30 areas were marked by springs; (3) water issues from rocks ranging from Precambrian to Cenozoic age with Cenozoic rocks predominating; (4) waters are associated with igneous and sedimentary rocks in equal proportions; (5) water occurs primarily in areas of extensive volcanism and secondarily in fault zones; (6) water discharges from springs near streams but mostly at points well above river levels; (7) discharge may be from fractures directly from beneath a talus cover, or from alluvium or some combination (1 spring discharged from a tufa mound); (8) median pH is 7.4; mediam maximum temperature is about 105 deg F; median discharge of springs is 30.5 gpm and medium concentration for sodium, 146 ppm; magnesium, 4.55 ppm, potassium, 4.6 ppm, and lithium, 0.28 ppm. Most thermal waters have been used for some purpose, but only 18 are now being used.

GROUND WATER YIELDS IN THE RALEIGH QUADRANGLE,
North Carolina University, Chapel Hill.
Charles W. Welby.
Water Resour Res Inst Rep 8, Univ N Car, May 1968. 61 p, 7 fig, 15 ref, 6 append. OWRR Project A-009-NC.

Descriptors: Bibliographies, Forecasting, *Groundwater, Crystalline rocks, *Water yield, Probability, North Carolina, Pump testing, *Water wells.

Development of a method for comparing water yields from wells drilled in crystalline rocks as the basis of a probability study of well yields is reported. The method utilizes curves drawn from data collected during short-term pumping tests and is designed for use in crystalline rocks and in the absence of observation wells. All measurements are made on the pumped well. The method was developed to take into account the nature of ground water occurrence in the crystalline rocks of North Carolina piedmont, and in particular the Raleigh, North Carolina, area. The curves and the principles on which they are based permit prediction of probable yields from a given well at a variety of pumping rates.

POTENTIAL GROUND-WATER HYDROLOGIC CHARACTERISTICS AS DETERMINED BY ELECTRIC RESISTIVITY CRITERIA,
Rhode Island University, Kingston.
John J. Fisher.
Water Resour Center, Univ RI, Final Rep, June 1967. 24 p, 7 fig, 10 ref. OWRR Project A-008-RI.

Descriptors: Geophysics, Resistivity, *Aquifer characteristics, Aquicludes, Water table, Sediments, Rhode Island, Physical properties, *Groundwater, On-site data collections, Electrical conductance, *Glacial drift, *Aquifers.

Subsurface glacial deposits on Block Island, Rhode Island were studied in the field by induced electrical resistivity surveys to determine groundwater conditions. Vertical depth profiles (to 200 feet) were developed to show correlation between lithology, ground-water characteristics and conductance (reciprocal of resistivity). Depth to water table, zone of groundwater, and the presence of aquifers and aquicludes could be determined from the conductance data. The water table had high conductance values, ranging from .012-.015 mhos while aquifers in the zone of saturation were higher, ranging from .012-.024 mhos. In contrast, aquicludes were lower, ranging from .001-.007 mhos. The zone of soil moisture was intermediate in value, ranging from .009-.016 mhos. (Author)

RESSLER V GERLACH)NEGLIGENT WELL CONTAMINATION(.
State of Pennsylvania, Harrisburg.

189 Pa Super 192, 149 A 2d 158-160 (1959).

Descriptors: Drill holes, *Wells, *Pennsylvania, Judicial decisions, *Water pollution, Septic tanks, Water wells.
Identifiers: Negligent contamination.

Defendant sunk a 30 foot hole on his land, about 90 feet from a 34 foot well on Plaintiffs' neighboring land. The hole was sunk to facilitate drainage from septic tanks servicing defendant's apartment buildings. Thereafter water in plaintiffs' well became contaminated. Plaintiffs notified the defendant and he immediately filled the hole with dirt. The well water subsequently became usable for a period of one week, but later the well went dry. Evidence showed that plaintiffs' well was dug through two layers of rock; the hole sunk by defendant was approximately to the same depth but did not go through the rock. There is no evidence to show that the defendant was negligent. Every man has a right to the natural use and enjoyment of his land and if while lawfully using his land, without negligence or malice, an unavoidable loss occurs to his neighbor, it is damnum absque injuria. (Molica-Fla)

COMMONWEALTH DEP'T OF HIGHWAYS V SEBASTIAN)DIVERSION LOSS OF UNDERGROUND STREAM(.
State of Kentucky, Frankfort.

345 S W 2d 46-47 (Ct App Ky 1961).

Descriptors: Judicial decisions, *Kentucky, Diversion, Diversion losses, *Underground streams, Alteration of flow, *Springs, Watercourses (Legal), *Surface - groundwater relationships, Grassed waterways, Channel flow, Percolating water, Preferences (Water rights), State governments, Condemnation, Administrative agencies, Natural flow doctrine.

Plaintiffs sought damages against the Commonwealth of Kentucky, Department of Highways, for the drying up of two springs on their farm resulting from a diversion of the flow of water to the springs by construction of a highway. In Kentucky where underground waters flow in unknown and undefined channels the owner of land, when putting his land to legitimate use, is not liable to the owner of adjoining lands for injuries to wells or springs fed by the stream. In the case of underground currents flowing in known and defined channels the rights of the parties are the same as with respect to surface streams. The evidence for plaintiffs was that the course of an underground stream running from a neighbor's land across the highway right of way to the springs was identifiable and marked by a line of green grass which grew on the surface. The court held the evidence as to the existence of an underground stream flowing in a known and defined channel was properly submitted to the jury. (Smodish-Fla)

HYDROLOGICAL STUDY OF THE LATTON GROUND-WATER SOURCE,
Swindon Corp Water Department, Swindon, Wilts, Great Britain.
A. R. Burton.
J Inst Water Eng, Vol 22, No 4, pp 287-293, June 1968. 7 p, 2 fig.

Descriptors: Underground water storage, Percolation, Foreign projects, Water yield, Permeability, Water table, *Aquifers, Specific yield, Thiem test, *Groundwater flow, Groundwater recharge, Ground water, Hydrology, Drainage basins, Rainfall.
Identifiers: Groundwater management, Mathematical models, Water wells, Great Britain.

Investigations for developing a new source of ground water demonstrate the relationship between ground-water parameters and the reliability of a mathematical model for predicting groundwater levels. Past records show that rainfall, abstraction, and water level are interrelated. Estimates of ground-water yield are made by extrapolating past measurements. A mathematical model was developed, assuming that the piezometric surface within the radius of influence of a discharging well is dependent upon the: (1) mean flow rate from the discharging well, (2) sum of previous discharged quantities, and (3) sum of recharged quantities. Ground-water recharge is assumed to be solely from rain percolation. The mathematical model requires only elementary algebraic expressions for predicting ground-water levels. Aquifer properties may be estimated from coefficients used in the mathematical model. (USBR)

AQUIFER AND MODELS,
U. S. Geological Survey, Albuquerque, N. Mex.
C. V. Theis.
Pap, Proc Ser No 4, Symp Amer Water Resour Assoc, San Francisco, Calif, pp 138-148, Nov 1967. 11 p, 6 fig, 9 ref.

Descriptors: *Aquifers, *Models, *Ground water, Dispersion, Hydraulic conductivity Permeability, Wells, Observation wells, *Groundwater flow, Anisotropy, Heterogeneity, Porous materials, Distribution, Homogeneity, Dyes, Hydrology.
Identifiers: *Groundwater movement, Transport phenomenon, *Hydrologic models, Fluorescent tracers, Flow distribution.

A new conceptual model containing the known heterogeneity of the natural aquifer is needed to explain transport phenomena in ground water. The difficult problem of making the 2 sides of the continuity equation consistent is discussed. Various phenomena that occur when considering horizontal flow in an elastic confined aquifer are described. Changing values of parameters common to horizontal and vertical flow are stated. A chart shows the movement and concentration of a fluorescein tracer in a very coarse and permeable aquifer at the Hanford AEC. The hydraulic conductivity in aquifers ranging from about 2 to 4300 gal/day/sq ft in the order they were encountered by the drill is given. Another chart shows the same beds arranged in order of increasing conductivity with the corresponding logarithms of the conductivities. The range of permeability in water-bearing formations is shown. A laboratory model showing lateral dispersion of water in a small model is described. (USBR)

LABORATORY EVALUATION OF SELECTED RADIOISOTOPES AS GROUND-WATER TRACERS,
Texas A and M Univ, College Station, Texas.
A. Ray Jennings, and Melvin C. Schroeder.
Water Resources Res, Vol 4, No 4, pp 829-838, Aug 1966. 10 p, 2 fig, 3 tab.

Descriptors: *Groundwater movement, Base flow, Aquifers, *Radioisotopes, *Tracers, *Tracking techniques, *Laboratory tests, Chelation, Distribution patterns, Ion exchange, Adsorption, On-site data collections, Velocity, Porosity, Radioactivity, Ions.
Identifiers: Elution, Exchange columns.

The determination of the rate and direction of ground-water flow with tracers provides knowledge that is useful in evaluating the water inventory of an aquifer. Antimony 121, cerium 141, chromium 51, indium 114, ruthenium 103, and strontium 85 in chelate form were tested in the laboratory. Distribution coefficients were determined for the chelated radioactive isotopes and for unchelated chromium 51 for chushed shale and limestone with calcium as the saturating ion by the batch-treatment procedure. These measurements could be used to predict the elution history of a tracer from an exchange column. Ghelated chromium 51 was found to be an adequate ground-water tracer. The average velocity of ground-water was equal to the sum of the tracer velocity plus the product of the tracer velocity, the distribution coefficient, and the bulk density of the aquifer divided by its effective porosity. (Affleck-Ariz)

FIELD OBSERVATIONS COMPARED WITH DUPUIT-FORCHHEIMER THEORY FOR MOUND HEIGHTS UNDER A RECHARGE BASIN,
Agricultural Research Service, Fresno, California.
W. C. Bianchi, and E. E. Haskell, Jr.
Water Resources Res, Vol 5, No 1, pp 1049-1057, 1968. 9 p, 4 fig, 5 tab.

Descriptors: *On-site tests, *Recharge, Groundwater recharge, *Groundwater basins, *Dupuit-Forchheimer theory, *Hydrographs, Theoretical analysis, Ponds, Mathematical models, Water spreading, Artificial recharge, Water table, Waste disposal, Aquifer characteristics, Equations, Vadose water, Boundaries (Surfaces).
Identifiers: Mounds, Groundwater mounds.

Using Dupuit-Forchheimer assumptions, the rising and falling hydrograph of a groundwater mound beneath the center of a square or circular recharge basin has been theoretically described. The study reported in this paper tested for general agreement between these theories and actual field observations taken at the center of two experimental recharge ponds. The study also attempted to weigh considerations of scale, measurement, and geologic reality as to their significance in the reliability of an idealized mathematical model for the rise and fall of a ground-water mound. In water spreading for artificial recharge or waste disposal, prediction of the position of the water table during and after spreading is of considerable operational importance. (Affleck-Ariz)
W69-01492

INVESTIGATIONS INTO THE UNIFORMITY OF RELATION BETWEEN GROUND WATER AND RAINFALL OVER PROLONGED PERIODS AND THE POSSIBILITY OF PREDICTING GROUND WATER LEVELS WITH SPECIAL CONSIDERATION OF DRY PERIODS,
J. Denner.
Dt Gewasserk Mitt, Vol 9, pp 73-85, 1965.

Descriptors: *Groundwater, *Rainfall-runoff relationships.
Identifiers: Calculations.

A report, including tabulated and graphical results, is given of extensive studies carried out in 6 German towns at varying intervals over a period of 54 years on the distribution of rainfall and run-off, effective precipitation and temperature and stream flow. The effect of these characteristics on the response of the water table and their relation to climatic changes are discussed; it was found that the water table tends to respond to rainfall in a characteristic pattern, making it possible to predict short-term changes in the ground-water level allowing for weather forecasts and dry weather periods. From these findings standard values for high medium low and very low rainfall are derived.

2G. Water in Soils

UNSATURATED FLOW IN DRAINAGE PROBLEMS,
Michigan State University, East Lansing.
R. J. Kunze.
OWRR Project A-003-MICH, Reprint, Amer Soc Civ Eng Proc, pp 40-45, Dec 1965. 3 p, 5 fig, 13 ref.

Descriptors: *Drainage, *Unsaturated flow, *Groundwater flow, Soil moisture, Hydraulic conductivity, *Flow, *Subsurface flow, Diffusivity, *Soil water movement.
Identifiers: Diffusion coefficient.

Differences and similarities in conductivity and diffusivity data curves along with the functional role of these 2 flow parameters are discussed. Soil-water diffusivity appears to be the more complete flow parameter for investigating internal drainage of soils. Diffusivities obtained with 2 different methods over a sizable moisture range are in relatively good agreement, but data indicate that the diffusivity is not only moisture-dependent but is affected by time-dependent changes of the soil-water system. The observed time-dependent effect is directly related to the applied head. For computing the moisture status in a draining soil profile by means of the finite-difference form of the flow equation, a precise knowledge of the moisture history, the transmission coefficient-head and the moisture content-head relationships is necessary.

SPATIAL VARIATION IN THE MOISTURE CONTENT OF SANDY SOILS UNDER PINE STANDS,
All-Union Institute of Forestry and Mechanization of Forestry, USSR.
N. A. Voronkov.
Soviet Soil Sci, Vol 10, pp 1337-1343, October 1967. 7 p, 2 fig, 3 tab.

Descriptors: Variability, *Arid climates, *Spatial distribution, *Moisture content, *Sands, Soil surfaces, Soil horizons, *Pine trees, Soil moisture, Meteoric water, Root zone, Rain water, Topsoil, Depth, Wetting.
Identifiers: *Sandy soils, Replications, Litter, Plots.

This article examined factors in spatial variation as well as influence of the latter on accuracy with which moisture content of sandy soils under pine stands could be determined. Variations in moisture content were determined at depths of 10-20, 40-50, and 140-150 cm. The amount of water retained by the litter was determined. There were different reasons for variations shown in the soil surface and deep horizons. Variation in moisture content of top soil horizons was due to uneven wetting, which was quite dependent on the thickness of the litter and the degree of moisture the day before it rained. In severely dried sandy soils, the reason for uneven wetting near the surface could have been the formation of a layer of saturated capillary-suspended moisture. In arid climates, such cases seemed to occur on open spaces under steppe vegetation and fallow where the top horizons would sometimes dry out below wilting moisture level. (Blecker-Ariz)

IMPROVEMENT OF SOIL MOISTURE IN THE CONVERSION OF CHAPARRAL TO GRASS,
California Univ, Riverside.
C. M. McKell, and J. R. Goodin.
Proc 9th Int Grassland Congr, Vol 1, pp 573-575, 1966. 4 p, 6 fig.

Descriptors: *Soil moisture, *Chaparral, *Grasses, Root zone, Vegetation effects, Moisture content, Rainfall, *Arid lands, Brush control, Planting management, Water loss, Ranges, *Water yield improvement, Wetting.
Identifiers: Overstory, Plots, Seedlings.

Experimental plots were established to follow soil moisture changes in the root zone of vegetation cover in southern California. The first site was on a northeast slope supporting chamise and oak. The second site was on north, south and east facing slopes and supported a cover of chamise and oak. At the first site, the 12 inch depth of soil showed the most erratic changes in moisture levels. Rapid wetting and drying cycles corresponded closely with occurring rainfall. A major factor in successful establishment of a new vegetation cover lies in moisture accumulation and conservation until the seedling is firmly enough established to draw upon

moisture reserves of a large soil volume. If native grasses are not present, removal of the overstory allows for an accumulation of soil moisture required for a successful program of range seeding. Correct timing with respect to rainfall and complete removal of the overstory are needed in arid areas in order to let native grasses make most efficient use of the moisture available to them. (Blecker-Ariz)

INFLUENCE OF EVAPORATION SUPPRESSANTS ON WATER MOVEMENT IN SOILS,
Adelaide Univ, Glen Osmond, South Australia, Waite Agricultural Research Institute, Dept of Agricultural Biochemistry.
J. W. Kijne.
Aust J Soil Res, Vol 6, No 1, pp 67-73, July 1968. 7 p, 1 fig, 2 tab.

Descriptors: *Alcohols, *Retardants, *Soil water movement, Soil amendments, *Diffusivity, Capillary action, *Evaporation control, Monomolecular films, Infiltration, Wetting, Bulk density, Air-earth interfaces.
Identifiers: Fatty alcohols, Hydrophobic properties.

A study was conducted to investigate the influence of fatty alcohols on the rate of water movement through unsaturated soil, and to compare the effect of these fatty alcohols with the effect of other soil amendments. The fatty alcohols and dodecylamine had a stronger influence on soil-water diffusivity throughout the whole range of soil-water contents than did krilium, polyvinyl alcohol and Carbowax. The capillary flow of water to the soil surface was markedly reduced when treated with fatty alcohols. Dodecylamine reduced the rate of infiltration into the soil. Heats of wetting of the treated soil samples indicated that penetration rate and diffusivity near saturation were reduced in accordance with the hydrophobic character of the absorbed compound. (Affleck-Ariz)

2H. Lakes

WATER QUALITY AND PRIMARY PRODUCTION OF SOUTH DAKOTA LAKES,
South Dakota State University, Brookings.
John G. Nickum, and Norman D. Schoenthal.
Water Resour Res, Tech Res Proj, Completion Rep, S Dak State Univ, Dec 1967. 7 p, 1 ref. OWRR Project A-002-SDak.

Descriptors: *Water quality, *South Dakota, *Lakes, *Reservoirs, Limnology, Biology, Chemistry, Water analysis, Soil-water plant relationships, Aquatic plants.

Physical, chemical, and biological aspects of 45 lakes in S. Dak. were studied from July 1965 to July 1967. Maximum water temperature at the surface reached 28 deg C. Most lakes exhibited continuous circulation except when ice covered. Thermocline formation was observed in 6. Light transmission was influenced by turbidity, and varied greatly, within and among the lakes. Dissolved oxygen concentrations ranged from near saturation to less than the recommended minimum for fish life. All lakes were basic ranging from a pH of 7.1 to 11.3. Specific conductance of lakes occupying open basins was lowest in the unglaciated area west of the Missouri River (70-590 micromhos at 25 C) and highest in Mankato drift of the Wisconsin ice age (330-1260 micromhos at 25 C). Concentrations of major anions and cations tended to follow patterns which were associated with major physical divisions of the state or various drift types of the Wisconsin ice age. Trace elements were found in most lakes studied. Those lakes which developed dense summer blooms of phytoplankton were usually dominated by the blue-green algae Aphanizomenon or Microcystis. The maximum concentration of Chlorophyll as observed was 19.1 mg/1. Chlorophyll concentrations were generally higher in lakes east of the Missouri River.

PRODUCTIVE CAPACITY OF NORTH AMERICAN LAKES AS RELATED TO THE QUANTITY AND TROPHIC LEVEL OF FISH, THE LAKE DIMENSIONS, AND THE WATER CHEMISTRY,
Dalhousie Univ, Halifax, Nova Scotia, Inst of Oceanography.
F. R. Hayes, and E. H. Anthony.
Trans Amer Fish Soc, Vol 93, pp 33-57, 1964. 5 p, 1 fig, 5 tab, 14 ref.

Descriptors: *Productivity, *Yield equations, *Secondary productivity, Eutrophication, Lake morphology, Comparative productivity, Regression analysis, Statistical models, Standing crop, Harvesting, Alkalinity, Fish types, Computers, Commercial fishing, Fishing, Census, Trophic level, Great Lakes.
Identifiers: Hayes Productivity Index.

A Productivity Index (PI) for lakes derived from catch or biomass of fish, is defined by regression, log PI=-0.236 + 0.000147a - 0.517b + 0.287c, where a = sq root of (100,000/area in sq km); b = log mean depth in m; c = log methyl orange alkalinity in ppm. Factors used in deriving regression include considerations of census method and trophic level of fish. T-test shows 3 slope constants in equation are highly significant. 10 alternative expressions for PI (using transformations of PI and functions of area, depth and alkalinity) resulted in coefficients of determination with range 0.301-0.665, as compared with 0.670 for best expression. Of this 67% in variability in PI for latter expression, 20% is due to areal function, 29% to depth, and 18% to alkalinity. Best equation yielded theoretical PI corresponding closely with observed PI in 41 lakes and lake groups. Ratio, observed PI/calculated PI, for variety of lakes or lake groups having various fisheries ranged from 0.43 for two Ontario lakes with trout angling to 3.73 for lake (Prince Edward Island) with pond fishery for small trout. Best value of ratio (0.91) was for L Ontario; 20 of 24 ratios reported fall within range 0.43-1.52.

STANDARD CORRELATIONS BETWEEN PELAGIC PHOTOSYNTHESIS AND LIGHT,
Uppsala Univ., Sweden. Inst. of Limnology.
Wilhelm Rodhe.
Mem Ist Ital Idrobiol, 18 Suppl, pp 367-381, 1965. 5 p, 8 fig, 1 tab, 9 ref.

Descriptors: *Photosynthesis, *Primary productivity, Light, Lakes, Oceans, Correlation analysis, Phytoplankton, Light penetration, Optical properties, Light intensity, Water properties, Mathematical models.
Identifiers: Transparency, Talling's model, Lake Tarfala, Lake Tornetrask, Sweden, Lapland, Lago di Varese, Lake Erken, Bodensee, Zurichsee, Worthersee, Grand Ploner See, Ossiacher See, Lago Maggiore, Le Leman.

Response of pelagic photosynthesis to vertical attenuation of light follows a general pattern, common to various types of lakes as well as to the sea. Based on Talling's model for the photosynthetic integral, and attempt is made to define quantitative standard correlations. These facilitate the assessment and interpretation of photic and non-photic effects upon primary production of phytoplankton. Data are presented for 12 lakes with Secchi disk transparencies of 1.7 to 13.7 m and with integral assimilation values (C) between 45 and 1600 mg carbon/sq m/day. The best relationship shows C to be the product of a parameter, optical depth at which light saturation of photosynthesis occurs, and maximal assimilation (B) in milligrams of carbon/cu m/day. Ratio of observed C to C calculated from above relationship gives a mean of unity, deviations from which do not exceed 6.7%. With a slight modification, relationship can also be used to approximate estimates of total photosynthesis in cases where only the optical properties of water and the maximal photosynthetic rate are known. This less exact relationship is shown to be C = (B) (A-prime), where A-prime is metric depth at which the most penetrating component of light is attenuated to 10%.

2I. Water in Plants

WATER LOSS THROUGH INTERCEPTION BY MIXED-OAK FORESTS IN RHODE ISLAND,
Rhode Island University, Kingston.
James H. Brown, Jr.
Water Resour Center, Univ RI, Completion Rep, June 1967. 4 p. OWRR Project A-001-RI.

Descriptors: *Interception, *Streamflow, *Canopy, Water loss, *Oak trees, *Throughfall, Deciduous forests, Rhode Island, Leaves.

Mixed-oak canopy was found to intercept 10.1% of rainfall received during a leafless period from February 1 to May 22, 1966, and 13.1% during the subsequent leaf period. Of the rainfall reaching the ground under the forest stands, throughfall amounted to 85.1% of rainfall received in the open during the leafless period, while stemflow amounted to 4.8%. In contrast, when leaves were present percentages were 83.3 and 3.6 for throughfall and stemflow, respectively. It was found that net precipitation during the leaf period was not influenced by size class of mixed-oak forest, at least within the range of size classes studied which included oak stands averaging 30, 40, and 50 feet in height. The same could be said for the leafless period except that stemflow yields differed under the three size classes. Large differences in stemflow were observed between different oak species. Differences were attributed to bark characteristics and branching habits. (Author)

STRUCTURE OF FOREST VEGETATION BORDERING THE SAYLORVILLE IMPOUNDMENT,
Iowa State University, Ames.
Roger Q. Landers, and Dana R. Sanders.
Iowa State Univ Sci Tech, Proj Completion Rep, Aug 1967. 27 p, 9 fig, 10 tab, 2 ref. OWRR Project B-006-Ia.

Descriptors: *Vegetation, Forests, Watershed management, *Slopes, Pre-impoundment, Surveys, Oak trees, Maple trees, Forest management.
Identifiers: Des Moines River (Iowa), *Saylorville Reservoir (Iowa).

Sites chosen in the Saylorville Reservoir area were studied from standpoints of classification, composition of slope forests, and preimpound-watershed description. Important canopy species in the majority of stands include elms, ironwood, and ash. On drier sites white oak and shagbark hickory are dominants, with important understory species of Ribes spp., Parthenocissus quinquefolia, and Xanthoxylum americanum. Red oak, black maple, and basswood are more abundant on mesic sites and characteristic understory species include Anemonella thalictroides, Parthenocissus quinquefolia, Hepatica acutiloba, Carex alursina, and Asarum canadense. The above 2 categories describe the majority of sites. Any number of tree species may be dominant in the canopy from site to site, and understory dominants also show this variation. In considering management of these slope forests, our hypothesis is that the great majority of slope forest species will not withstand periods of flooding. Changes in structure and composition of vegetation will occur. This results in a predominance of opportunistic species capable of withstanding the stresses of flooding but undesirable for recreational use or watershed protection.

STRUCTURAL CHARACTERISTICS OF BENTHIC ALGAL COMMUNITIES IN LABORATORY STREAMS,
Oregon State Univ, Corvallis.
C. David McIntire.
Ecol, Vol 49, No 3, pp 520-537, Late spring 1968. 18 p, 5 fig, 7 tab, 31 ref.

UNIVERSITY OF ILLINOIS - URBANA

Descriptors: *Laboratory tests, *Benthic flora, *Aquatic algae, *Biological communities, Streamflow, Currents (Water), Diatoms, Cyanophyta, Light intensity, Productivity.
Identifiers: *Autecology, Species diversity, Community structure.

Effects of light intensity and current velocity on species composition and ecology of benthic algal communities were examined in laboratory streams. Of 15 diatom taxa studied, only Melosira varians, Navicula radiosa and Meridion circulare were more abundant in streams receiving 700 ft-candles of light than in those at 150 ft-candles. Achnanthes exigua, A minutissima, Meridion circulare, Rhoicosphenia curvata and Navicula radiosa were indifferent to current velocity, which had a positive effect on quantity of Navicula cryptocephala, N minima, N seminulum, Nitzschia linearis, Achnanthes lanceolata, Synedra ulna, Gomphonema parvulum, G angustatum, Cocconeis placentula and lanceolate Nitzschia. Melosira varians was more abundant in standing water. Of six non-diatom taxa, Anabaena variabilis and Tribonema minor were more abundant in streams at higher light intensity and Phormidium retzii was more abundant in moving water than in standing. At a particular season, light intensity and current velocity conditions in laboratory streams allow establishment of an algal community with characteristic species composition, biomass, pigment concentration and increment of export. To understand productivity in such communities one needs knowledge of the autecologies of community constituents and of mechanisms regulating floristic diversity and species composition.

MOISTURE USE OF PASTURE PLANTS IN A DESERT ENVIRONMENT,
Volcani Institute of Agricultural Research, Rehovot, Israel; Hebrew University of Jerusalem.
N. H. Tadmor, O. P. Cohen, and L. Shanan.
Proc 10th Int Grassland Congr, pp 897-906, 1967. 10 p, 3 fig, 2 tab, 24 ref.

Descriptors: *Water requirements, Water utilization, Grazing, Crop response, *Vegetation establishment, Deserts, *Drought resistance, Arid lands, Evapotranspiration, Plants, Ranges, Surface runoff, Slopes, *Water spreading, Soil-water-plant relationships, Pasture management, *Soil moisture, Carrying capacity.
Identifiers: Israel, Perennials, Annuals, Negev Desert.

The paper summarized data on water requirements and drought resistance of seven range plants at Advat Desert Research Center in the Central Negev desert of Israel. It was shown that even in a 100 mm rainfall desert some of the most useful perennial and annual pasture plants may be established and maintained by exploiting surface runoff from desert slopes. Even under such extreme drought conditions some of the plants investigated gave high yields and were efficient water users, giving a performance comparable to that of irrigated forage crops. Water-spreading in the bottomlands seemed to be a feasible method for improving the overall desert range with regards to carrying capacity, season of use and nutritive potential. Differences in water use between plants were related to length of growing season and rooting depth. (Blecker-Ariz)

2J. Erosion and Sedimentation

THE EFFECT OF A PERMEABLE BED ON SEDIMENT MOTION,
Georgia Institute of Technology, Atlanta.
C. S. Martin.
Water Resour Center, June 1966. 67 p, 38 fig, 13 ref. OWRR Project B-004-Ga.

Descriptors: *Beds (Stream), *Sediment transport, *Porous media, *Seepage, *Earth-water interfaces, Hydraulic gradient, Permeability, Slope stability, Bottom sediments, Hydrodynamics, Beds under water, Sediment-water interfaces, Stream erosion, Degradation (Stream).

The seepage force on uniform, cohesionless bed particles (sand) that comprise the top layer of a stream bed was determined experimentally. Slope stability tests were conducted by directing water normal to the plane of the bed. Results of tests for which the water flowed vertically upward into a horizontal bed were the most conclusive. The seepage force on the grains forming the interface was found to be about one-half the seepage force on grains well within the bed. Tests were made on the erosion rate following incipient failure with the bed in a horizontal position and the flow directed vertically upward. The rate of erosion was correlated with the rate of seepage (hydraulic gradient). A hydraulic gradient corresponding to an extrapolated rate of erosion of zero was minus 3.2. The corresponding seepage force on grains at the interface is about one-third the seepage force well within the bed. The seepage force on uniform, cohesionless bed particles at the sand-water interface is correlated to be about one-third to one-half the seepage force on particles well within the bed.

2K. Chemical Processes

INTERACTION BETWEEN ALUMINUM AND PHOSPHATE IN AQUEOUS SOLUTION,
Rutgers-the State Univ, New Brunswick, NJ, Dept of Soils and Crops.
Pa Ho Hsu.
Related to OWRR Project B-008-PA: 'Removal of Phosphate from Water by Aluminum and Iron', October, 1968. Advances in Chemistry Series, No. 73, pp. 115-127, 1968.

Descriptors: Hydrolysis of Al3+/hydroxy-aluminum polymers, Soluble aluminum phosphate complexes, Aluminum phosphate precipitates, Phosphate removal.

This report deals with the reaction mechanism between aluminum and phosphate. It was found that by adding NaOH to AlCl3 solutions the resultant solutions contained Al3+ ions and also positively charged hydroxy-aluminum polymers. The polymers and Al3+ ions yielded different reaction products with phosphate. Hydroxy-aluminum polymers were completely and immediately precipitated by phosphate at their isoelectric points. This precipitation is interpreted to be a simple 'neutralization' of the net positive charge of polymers by the phosphate anion. Al3+ formed soluble complexes with phosphate, no precipitate being observed up to a H2PO4/Al molar ratio of eight. In solutions which contain both polymers and Al3+, each reacted with phosphate separately, and the reation product will depend greatly on the nature of the aluminum originally present in the solution. CURRENT STUDIES IN PAMLICO RIVER AND ESTUARY OF NORTH CAROLINA,
North Carolina University, Chapel Hill.
Donald B. Horton, Edward J. Kueuzler, and William J. Woods.
Water Resour Res Inst, Univ N Car, July 1967. 21 p, 2 fig, 4 tab, 7 ref. OWRR Project A-014-NC.

Descriptors: *Dye releases, Tracers, *Estuaries, *Model studies, Tidal effects, River flow, Salinity, Stratified flow, Inflow, *Path of pollutants, Dispersion, Diffusion, Currents (Water), Diffusivity.
Identifiers: *Rhodamine B, *Flushing time.

Rhodamine B dye was released in the Pamlico River estuary during the summer of 1967. The movement and concentration of the dye was followed wow through cuvettes. The average net movement of the dye patch was 915 m per day downstream. This movement was compared to predicted water movements derived from a tidal prism model of estuarine flushing. Under low fresh water inflow conditions as existed at the time of dye insertion, the predicted average transport was only 213 m per day. The discrepancy was due to a combination of factors inherent in the application of the theoretical model: (1) Possible substantial errors in the estimation of fresh water inflow; (2) No independent estimation of wind transport; (3) Vertical variation in fresh water outflow. The theoretical model was used to estimate flushing under average waterflow conditions. Under these conditions corrections for vertical stratification were possible and substantial errors in the estimation for fresh water inflow were obviated. Flushing time was estimated to be 65 days for the entire length of the estuary. Although there was a discrepancy between observed and calculated salinities, diffusive salt flux could account for the differences. Independent water current determinations did fit the model results.

DELWARE ESTUARY COMPREHENSIVE STUDY PRELIMINARY REPORT AND FINDINGS.
Federal Water Pollution Control Admin., Phila., Pa.

July 1966, 113 pp, figs.

Descriptors: *Estuaries, Water quality, *Storm runoff, *Overflow, *Water pollution, *Sampling, *Biochemical oxygen demand.
Identifiers: *Combined sewers.

The Delaware river estuary - particularly the segment between Trenton and the Pennsylvania-Delaware state line below Wilmington - was studied from the points of view of municipal and industrial waste discharges, water quality and its improvement by five specific alternative objective sets, water use, costs and benefits of projected improvements, and guidelines for implementation. Stormwater overflow discharges (discussed on pp. 24, 61, 92) are considered esthetically objectionable, although in comparison with other waste input it does not constitute a large source of oxygen-demanding pollution of the estuary. A continuation of the reported stormwater sampling program is urged, and a demonstration project to counteract undesirable effects of combined sewer overflow is recommended.

LEGAL ASPECTS OF WEATHER MODIFICATION--SNOW PACK AUGMENTATION IN WYOMING,
Wyoming University, Laramie.
John M. Pierce.
Land Water Law Rev, Vol II, No 2, pp 273-319, 1967. 47 p, 167 ref. OWRR Project A-999-Wyo.

Descriptors: *Weather modification, *Legal aspects, Snowpacks, Water yield improvement, Snowmelt, Flow augmentation, *Developed waters, Water allocation (Policy), Water resources development, Cloud seeding, Water supply.

The article focuses on the legal problems of ownership, control and liability as they are related to snowpack augmentation. Snowpack augmentation is but a small segment of weather modification, other segments--fog, hail, rain--are briefly mentioned. A discussion and analysis of the very few cases and statutory enactments is included, as is a discussion of the various legal theories on which the ownership of clouds and moisture can be predicated. The allocation of any runoff which results from snowpack augmentation must be considered in light of documents presently controlling the allocation of water--as an example the Colorado River Compact is studied. The increased runoff resulting from snowpack augmentation may be viewed as imported or developed water, and cases dealing with both imported and developed waters are studied. Other aspects--the right to store increased runoff in existing facilities, the importer's right to use the natural channel and the liability of the weather modifier are also discussed. (Wing-Wyoming)

AN ACT...TO CONSERVE AND PROTECT WATER RESOURCES OF THE STATE: TO PROVIDE FOR CLASSIFYING OF ALL WATERWORKS, WASTEWATER WORKS AND INDUSTRIAL WASTEWATER WORKS...
Maryland Laws ch 430 (1967).

Descriptors: *Maryland, Legislation, Administrative agencies, Classification, Legal aspects, *Regulations, Waterworks, Waste water treatment, Industrial wastes.
Identifiers: *Certification, *Superintendants, Fines.

Section 406A was added to Article 43 of the Annotated Code of Maryland (1965 Replacement Volume), title 'Health', subtitle 'Water, Ice and Sewerage.' The Act provided for the classification of all water works, wastewater works and industrial wastewater works. It also required the examination and certification of all superintendants, the people in charge of the operation of the various waterworks. A governor appointed Board of Certification was established to implement the requirements. The State Department of Health and the State Department of Water Resources was directed to provide training to prepare superintendants for certification. A fine of $25 a day was established for any violation of the Act. (Sisserson-Fla)

SOIL MOISTURE AND TEMPERATURE CHANGES FOLLOWING SAGEBRUSH CONTROL,
Wyoming Univ., Laramie.
Herbert G. Fisser.
J Range Manage, Vol 21, No 5, pp 283-287, September 1968. 5 p, 7 fig.

Descriptors: *Temperature, *Soil moisture, *Sagebrush, *Productivity, *Grasslands, Arid climates, Water loss, Seimarid climates, Seasonal, Soil temperature, Shrubs, Moisture availability, Brush control, Wyoming, Vegetation effects, Crop response, Grazing, Rainfall disposition, Soil-water-plant relationships.
Identifiers: Herbage, *Mesic.

A study was conducted in western Wyoming to evaluate soil moisture, soil temperature and herbage production changes following chemical control and non-grazing treatments of big sagebrush. Two sites, one a mesic grassland and the other an arid shrub type were studied. Soil moisture recharge during the spring period at the mesic site was much greater under the non-use treatment than in the grazed area. Soil moisture withdrawal was similar at both the arid and mesic sites. Variation of seasonal moisture levels combined for all depths and years showed a much greater variation at the mesic site than at the arid site. At the mesic site, grasses utilized almost all available moisture in the upper two feet of the soil. That which was not utilized moved downward to accumulate in the 36-60 inch zone from which sagebrush draws its major water supply. (Blecker-Ariz)

TOPOGRAPHIC MODIFICATION OF LAND FOR MOISTURE ENTRAPMENT,
Nebraska Univ, Lincoln.
H. D. Wittmuss.
Trans Amer Soc Agr Eng, Vol 11, No 3, pp 384, May-June 1968. 1 p.

Descriptors: *Topography, Moisture content, *Runoff, Semiarid climates, *Land forming, Terracing, Land management, Great Plains, Soil moisture, Soil management.
Identifiers: Bench terraces.

Conservation bench terraces provide a more effective means of moisture conservation than the practice of summer fallow in semi-arid regions of the United States. Graded terraces allow water to run off when heavy rainfall occurs, whereas level terraces with closed ends concentrate runoff water in the terrace channel where deep percolation occurs. Runoff losses from graded terraces averaged 1.2 inches per year during the 11-year study period. Results indicated that substantial yield increases could be expected by leveling the terrace channel which would alleviate deep water ponding in the terrace channel and increase efficiency of water use by crops. Level or graded terraces could be employed in arid climates to utilize soil and water resources more effectively. (Blecker-Ariz)

PROBLEMS OF LAND MANAGEMENT IN THE VARIOUS PHREATOPHYTE ZONES,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colorado.
Jerome S. Horton.
66-3 Meeting of the Pacific Southwest Interagency Committee, Albuquerque, New Mexico, August 30, 1966. 6 p.

Descriptors: Arid climates, *Land management, *Phreatophytes, *Tamarisk, Transpiration, *Water yield improvement, Ecology, *Brush control, Intermittent streams, Perennial streams, Vegetation effects, Water temperature, Flood plains, Transpiration, Playas, Riparian plants.
Identifiers: Shade.

Land occupied by phreatophytes presents a problem not solely in plant eradication, but also in land management in order to bring about proper use of all resources inherent in the West. Tamarisk or saltcedar, which is a very common phreatophyte, is discussed with respect to origin, ecology and position as an aggressive phreatophyte in the West. Cutting of vegetation along perennial and intermittent streams in the Southwest will have a compounding effect since the removal of shade will increase water temperature, which will create greater evaporation losses that may not be compensated in full by reduced transpiration from the smaller number of trees. (Blecker-Ariz)

THE IMPROVEMENT OF DESERT RANGES IN UZBEKISTAN,
All-Union Research Institute of Darakul Sheep Husbandry, Samarkand, USSR.
I. Sh Shamsoutdinov.
Proc 10th Int Grassland Congr, pp 960-962, 1967. 3 p.

Descriptors: *Sagebrush, Arid lands, Soil moisture, *Shelterbelts, Deserts, *Ranges, *Vegetation establishment, Forages, Winter, Productivity.
Identifiers: Uzbekistan, Saksaul, Fodder, Ephemer.

The planting of black saksaul shelter belts in Sagebrush-ephemer deserts together with the establishment of fall-winter ranges in foot-hill deserts and cultivation of fodder crops, without irrigation, to provide feed on ranges in winter are ways that are used to conserve moisture on desert ranges. Black saksaul shelter belts act as windbreaks and snow accumulators. The nearby humidity level is increased and as a result a milder and more stable microclimate is created which promotes normal growth and development of range plants. (Blecker-Ariz)

LIBRARY OF THE ARMY - WASHINGTON, D.C.

Identifiers: Mesic, Turgor pressure, Crawl.

Soil moisture tensions at the permanent wilting percentage were determined with five plant species on soils with high and low moisture conductivity. Results ranged from 39 atmospheres with Agropyron intermedium to seven atmospheres with Helianthus annuus and showed highly significant differences between soils, species and environmental conditioning. The major limiting factor determining the permanent wilting of plants was the rate of moisture contrast to the 15 atmosphere concept. Xeric species or plants hardened by environmental conditioning may withstand high soil moisture tensions while soil moisture moves slowly to their roots. Such plants may have low permanent wilting percentages and may take up and utilize water held at tension considerably above 15 atmospheres. This condition can occur in many arid parts of the world. (Blecker-Ariz)

ECONOMIC FACTORS IN THE IMPROVEMENT OF ARID AND SEMI-ARID GRASSLANDS,
Forest Service, Division of Range Management.
L. Rader.
Proc 9th Int Grassland Congr, Vol 2, pp 1593-1597, 1966. 5 p, 1 tab.

Descriptors: *Arid climates, *Economic feasibility, *Grasslands, Range management, *Sagebrush, Droughts, *Semiarid climates, Productivity, Cost-benefit analysis, Brush control, Carrying capacity, Livestock, Grazing, Vegetation regrowth, Pasture management.

Range improvement and management practices can be used to increase productivity of arid and semi-arid grazing lands. An analysis of factors influencing costs and returns from range improvement, using removal of sagebrush as an example, suggests that actual costs of improvement are related to the method of improvement, site conditions and size of the area improved. Sagebrush grows in areas where precipitation is low and where there are large fluctuations in annual rainfall with frequent and often prolonged droughts. With removal of sagebrush, more water becomes available for the growth of grass. This in turn will increase range carrying capacity and result in increased livestock production. Examples of three possible situations and two levels of improvement costs are given. They illustrate that improvement of sagebrush ranges may be profitable on better sites and that relatively small investments may be justified on sites where potential capacity is low. (Blecker-Ariz)

PHREATOPHYTES-WATER USE AND POTENTIAL WATER SAVINGS,
Agricultural Research Service, Boise, Idaho.
Dean C. Muckel.
J Irrig and Drain Div ASCE, Vol 92, No IR 4, Proc Paper 5033, pp 27-34, Dec 1966. 8 p, 2 fig, 2 tab.

Descriptors: *Phreatophytes, *Water utilization, *Water conservation, *Evapotranspiration, Arid climates, Semiarid climates, *Brush control, Tamarisk, Water table, Plant populations.
Identifiers: Greasewood.

Salvage of water consumed by phreatophytes of low economical value had long been considered, and increasing emphasis is being placed on this source of water in the arid and semi-arid west. Evaluation of potential savings in water use requires that water use be estimated under present and modified conditions. The problems of measuring evapotranspiration by phreatophytes were examined. Salvage of water now being used is difficult because the plants are persistent and difficult to eradicate. Three methods of salvage were listed. The eradication of both salt cedar and greasewood were discussed. (Affleck-Ariz)

3C. Use of Water of Impaired Quality

PHOTOSYNTHESIS AND RESPIRATION OF FOUR PASTURE GRASSES AS AFFECTED BY MOISTURE CONDITIONS AND SALINITY,
Florida Univ, Agricultural Experiment Station.
Vincent N. Schroder.
Proc 10th Int Grassland Congr, pp 181-184, 1967. 4 p, 4 tab.

Descriptors: *Pastures, *Grasses, *Soil moisture, Salinity, Photosynthesis, Respiration, *Plant growth, *Salt tolerance, Flooding, Irrigation effects, Water injury, Soil-water-plant relationships.

A study was designed to determine tolerance of several widely grown pasture grasses to salinity and flooding and to study the effect on rates of photosynthesis, respiration, and overall growth. The four warm-season grasses were: Pangola grass, Pensacola Bahia grass, Coastal Bermuda grass and St. Augustine grass. All four species were tolerant to levels of sodium chloride as high as 4500 ppm in the irrigation water. Continuous flooding for a period of 36 days was not harmful. Bermuda and St Augustine grass were the most tolerant of high levels of salt. Chemical data suggested that Bermuda grass does not absorb sodium as readily as the other grasses and that St. Augustine grass absorbed and could tolerate higher levels within the plant. Since salinity is usually considered to affect growth in a large measure by imposing a water stress on plants, data in the study could be used in arid regions where water stress is an important aspect of plant growth. (Blecker-Ariz)
W69-01479

SPRINKLER IRRIGATION WITH HIGH SALT-CONTENT WATER,
Arizona Univ, Tucson.
C. D. Busch, and F. Turner, Jr.
Trans ASCE, Vol 10, No 4, pp 494-496, 1967. 3 p, 2 fig, 5 tab.

Descriptors: Irrigation systems, Irrigation effects, *Saline water, *Sprinkler irrigation, *Cotton, Diurnal, Crop response, Water quality, Water loss, Water requirements, Toxicity, Leaves, Evaporation, Furrow irrigation, Surface irrigation.

A study was conducted in Safford, Arizona, to determine the effects of saline water sprinkling on the yield of cotton. Besides comparing day versus night sprinkling, the study included comparisons of flat and furrowed soil surface on both long staple (S-2) and short staple (1517D) varieties of cotton. The two-year study of sprinkling cotton with saline (3,160 ppm) water showed that the higher daytime evaporation losses from sprinkling markedly affect both the sodium content in plant leaves and the crop yield. The normal diurnal fluctuations plus problems of sprinkler adjustment suggested that night sprinkling presented a reasonable procedure for sprinkler irrigation with water classified as poor in quality. Descriptors: *Drainage systems, *Planning.
Identifiers: *Urban drainage, Hawaii.

Perimeter drainage is challenging approach for providing drainage protection to urban lands; essential in its concept is consideration of alternative uses of existing natural water courses; by using man-made waterways to supplement, alter, or entirely eliminate existing natural drainage pattern, perimeter drainage affords means of providing adequate protection to urban lands, while preserving and enhancing their economic and aesthetic values; successful experience in Hawaii suggests that perimeter drainage has considerable merit in urban planning and development and should be given more serious attention in well-planned urban lands.

AN ACT AMENDING THE ACT OF MAY 15, 1945)PL 547(, ENTITLED, AS AMENDED, 'AN ACT RELATING TO SOIL CONSERVATION AND SOIL EROSION...',
State of Pennsylvania, Harrisburg.

Laws of Penn 1967, Act 382.

Descriptors: *Pennsylvania, Legislation, *Administrative agencies, State governments, Soil conservation, Water conservation, Adoption of practices, Erosion control, Project purposes, Local government, Project planning, Erosion control, *Standards, Administration, Social aspects, Management, Soil management, Water management.

A state soil and water conservation commission is established, consisting of four farmers and two urban members in addition to state administrative officers and the dean of the state college of agriculture. Commission duties include coordination of soil and water conservation programs among the various districts herein described, extension of government aid to land and water management programs and to private lands, and creation of soil and water conservation districts when the various county commissioners and rural landowners favor such action. Membership in the board of the county water and soil conservation districts is governed. Qualifications of and terms of office for the members of both the state commission and the various county commissions are detailed. (Blunt-Fla)

SEEDING ANNUALS AND PERENNIALS IN NATURAL DESERT RANGE,
Hebrew University of Jerusalem; Volcani Institute of Agricultural Research, Newe Ya'ar Experiment Station.
N. H. Tadmor, M. Evenari, and J. Katznelson.

J of Range Manage, Vol 21, No 5, pp 330-331, September 1968. 2 p, 1 tab.

Descriptors: Rainfall, *Planting management, *Deserts, Arid climates, Vegetation regrowth, *Water spreading, *Plant growth, *Pasture management, Ranges, Moisture deficit.
Identifiers: Israel, Negev Desert, *Annuals, *Perennials.

An investigation was conducted in 1960-61 to study range seeding under desert conditions at the Avdat Desert Research Center in the central Negev of Israel. Seeding of pasture plants in a 78-mm rainfall desert resulted in complete failure of all perennials to establish themselves. Annuals, in spite of stunted growth, completed their life cycle and produced seed. Water-spreading was a prerequisite for successful establishment of perennial pasture plants under desert conditions. THE BREEDING OF SPINELESS CACTUS)OPUNTIA SPP(AS A DROUGHT RESISTANT FODDER CROP,
Research Institute of the Karoo Region, Middelburg, C P, Republic of South Africa.
G. C. de Kock.
Proc 9th Int Grassland Congr, Vol 2, pp 1459-1460, 1966. 2 p, 1 tab.

Descriptors: *Plant breeding, *Cacti, *Drought resistance, Plant growth, Arid climates, Insect resistance, Semiarid climates, Seed treatment, Irradiation, Gamma rays, Crop response, Germination, Genetics, Forages.
Identifiers: Cross breeding, Nutritive value, Succulents, Spineless cactus, Republic of South Africa.

The Republic of South Africa has a breeding program which aims at the improvement of the spineless cactus (Opuntia spp) with respect to drought resistance, fodder yield, palatability, nutritive value and insect resistance. Variations were obtained by cross-breeding and treating air dry seed of different spineless cactus cultivars with gamma rays. With the considerable variation obtained by the propagation of seed, gamma irradiation of seed and the treatment of seed with chemicals, it is possible to improve the cross-pollinated drought resistant spineless cactus fodder plant by selection and cross-breeding. THE INFLUENCE OF GRAZING- AND CUTTING-TREATMENTS ON WATER USE UNDER PERMANENT PASTURES IN GERMANY,
Bonn Univ, Institut fur Pflanzenbau, Germany.
H. G. Kmoch.
Proc 10th Int Grassland Congr, pp 137-140, 1967. 4 p, 1 fig, 3 tab.

Descriptors: Grazing, Arid climates, *Pasture management, Pastures, *Soil moisture, *Plant growth, Nitrogen, *Cutting management, *Water utilization, Moisture uptake, Growth stages, Leaves, Root systems, Fertilizers, Rainfall.
Identifiers: *West Germany, Stems, Neutron Scattering Method.

A grazing experiment was developed to compare long-term effects of constant grazing or cutting at different stages of plant growth. Soil moisture was measured by the Neutron Scattering Method. The differences between stem-stage and leaf-stage decreased in dry years compared with wet years, as far as the first cutting was concerned. In arid parts of the world, the reduction in vigor of roots, and the subsequent diminished water uptake from the subsoil, was taken into consideration as a cause of overgrazing. It was hard to explain why dry periods of equal length and intensity sometimes brought great hazards to pasture production and sometimes did not. Nitrogen fertilization was considered in connection with its effect on the increased depth and extension of the root system which could help to overcome dry periods. (Blecker-Ariz)

THE EFFECT OF SOIL MOISTURE REGIME AND NITROGEN APPLICATION ON THE PRODUCTION OF A PERRENNIAL PASTURE MIXTURE,
Department of Agriculture, South Australia, Australia.
P. Judd.
Proc 9th Int Grassland Congr, Vol 2, pp 1191-1197, 1966. 7 p, 5 tab, 21 ref.

Descriptors: *Soil moisture, *Arid climates, *Nitrogen, *Pastures, Fertilizers, Moisture tension, Clovers, Perennial ryegrass, *Moisture stress, Water utilization, Pasture management, Rates of application, Crop response, Grasses, Irrigation effects, Productivity.
Identifiers: Dry matter, Quadrats.

An experiment was established at the Milang Irrigation Research Center in South Australia to gain better understanding of the use of nitrogen and water and their effects on pasture yield, botanical composition and general economics of production. Three soil moisture regimes (30 cm, 20 cm and 12 cm Hg tension) and three levels of nitrogen application (0, 98.4 and 295.2 lb N per acre) were applied during the summer to a perennial pasture. Clover was highly sensitive to moisture stress and was therefore at a competitive disadvantage as soil moisture stress increased. Ryegrass showed no response without nitrogen application. Total production and production per unit of water applied increased as soil moisture stress decreased. Fertilizer nitrogen, through the medium of grass production, increased the yield per unit of water applied and this compensated for moisture stress. The plants on a well fertilized arid range will make the most efficient use of the moisture available to them. (Blecker-Ariz)
W69-01481

THE MANAGEMENT AND UTILIZATION OF SPINELESS CACTUS)OPUNTIA SPP(,
Research Institute of the Karoo Region, Middleburg, C P, Republic of South Africa.
G. C. de Kock.
Proc 9th Int Grassland Congr, Vol 2, pp 1471-1474, 1966. 4 p, 2 tab.

Descriptors: *Cacti, Semiarid climates, Arid climates, *Drought resistance, Droughts, Grazing, Contour farming, *Browse utilization, Water conservation, Soil conservation, *Forages, Vegetation establishment, *Planting management, Nutrients.
Identifiers: Succulents, Spineless cactus, Saltbush, Fodder, Republic of South Africa.

In arid regions of the Republic of South Africa, drought resistant fodder crops such as spineless cactus and Oldman Saltbush have been planted extensively and used as a source of feed and water reserves during droughts. Spineless cactus yields considerable quantities of succulent plant material under comparatively unfavorable climatic conditions and retains its succulence even during droughts. When planting is done on the contour, the plants serve as a wind break, reduce runoff and this way conserve both soil and water. Spineless cactus cultivars Monterey, Chico, and Robusta were used in the trials. (Blecker-Ariz)

EFFECT OF DRYLAND LEVELING ON SOIL MOISTURE STORAGE AND GRAIN SORGHUM YIELD,
Agricultural Research Service, Manhattan, Kansas.
Leon Lyles.
Trans ASAE, Vol 10, No 4, pp 523-525, 1967. 3 p, 4 tab.

Descriptors: *Land forming, *Dry farming, Growth stages, *Soil moisture, Water utilization, Texas, *Water storage, Fallowing, Runoff, *Sorghum, Topography, Crop response, Rainfall-runoff relationships, Water table, Surface runoff, Sampling.
Identifiers: *Rio Grande Valley (Texas).

In the Lower Rio Grande Valley of Texas effects of leveling non-irrigated land on stored soil moisture and hybrid grain-sorghum were studied for three years at three paired sites. Even though leveled fields showed more stored moisture than non-leveled fields following runoff-producing rains in the fallow season, these differences largely disappeared by seeding time. At seeding time only about 6 percent of fallow-season rainfall was stored in the 6 ft soil profile. Average test period grain yields showed slight advantages of 50, 50, and 80 lbs per acre in favor of the leveled fields over non-leveled fields of sites 1, 2, and 3 respectively. Other possible advantages of non-irrigated land leveling were noted. (Affleck-Ariz)

CONSERVATION BENCH TERRACES IN TEXAS,
Agricultural Research Service, Bushland, Texas.
Victor L. Hauser.
Trans ASAE, Vol 11, No 3, pp 385-386, 392, 1968. 3 p, 3 fig, 3 tab.

Descriptors: *Water conservation, *Dry farming, *Bench leveling, *Terracing, Texas, *Erosion control, Fine-textured soils, Soil water, Runoff, Crop response, Watershed management, Water storage, Wheat, Sorghum.
Identifiers: Water erosion, *Conservation bench terraces.

The conservation bench terrace is a structure designed to conserve runoff water for crop use on dryland and to control water erosion. Ten years of research with farm-size fields at Bushland, Texas showed conservation bench terraces to be an improved terrace system for the fine textured soils of the Southern Plains. Bench terraces increased total crop production from a farm-size unity 1.5 times the production achieved by level terraces. Conservation benches stored more water than a bench-leveled area and the same amount as level terraced fields after eleven months of fallow. (Affleck-Ariz)

DISCUSSION OF AQUEDUCT CAPACITY UNDER AN OPTIMUM BENEFIT POLICY,
Illinois Univ., Urbana.
S. Ramaseshan.
Amer Soc Civil Eng Proc, Vol 88, No IR2, pp 97-100, June 1962.

Descriptors: *Aqueducts, Benefits, Digital computers, Distribution systems, *Economic efficiency, *Linear programming, Dynamic programming, Monthly, Multiple-purpose, Optimization, Reservoir design, Reservoir operation, Seasonal, Water distribution (Applied).

A linear programming model is presented which takes into account more facets of the aqueduct sizing problem than Hall's dynamic programming model. Monthly variations in inflow and outflow, a curvilinear cost function for the channel and reservoir and convex benefit function are used in the model. No overyear storage or overflow in a normal year is assumed. Physical constraints are placed upon the aqueduct flows, total outflows and the net storage in each time period. For 3 aqueduct sections, 3 ranges of benefit functions and 12 months, there are 276 equations with 274 slack

LIBRARY OF THE UNIVERSITY OF ILLINOIS - URBANA

variables and 108 real variables. A trial and error solution is required. Values for the flow in the 3 sections can be chosen by random sampling, systematic sampling or by the single factor method. It is suggested that by analysis of the model for different reservoir sizes, the optimum storage capacity can be determined. (Gysi-Cornell)

PRODUCT-MIX ALTERNATIVES: FLOOD CONTROL, ELECTRIC POWER, AND IRRIGATION,
Stanford Univ., Palo Alto, Calif.
Alan S. Manne.
Int Econ Rev, Vol 3, No 1, pp 30-59, Jan 1962. 8 fig, 8 tab, 19 ref, 1 append.

Descriptors: *Linear programming, Markov processes, *Multi-purpose reservoirs, Economic efficiency, Optimization, Flood control, Electric power rates, Irrigation.
Identifiers: Economic trade offs.

Stochastic linear programming was used to determine the optimal operating policy of a single reservoir used for flood control, electric power, and irrigation. The probability of inflows into the reservoir were assumed to be uncorrelated. The model was assumed to have an infinite horizon. The objective was to maximize expected annual benefits subject to certain constraints of statistical equilibrium. A hypothetical example was solved. The conclusion was that the higher the level of storage capacity reserved for flood protection during the wet season, the lower became the expected hydroelectric benefits. Results were presented and analyzed in the form of product-mix curves and tables. An intrepretation of the dual variables was presented. Modifications were suggested in the model to account for head-height effects and benefits from irrigation. Comparison between the probabilistic and deterministic calculations are given in an appendix. (Gablinger-Cornell)

THE USE OF STORAGE WATER IN A HYDROELECTRIC SYSTEM,
Massachusetts Institute of Technology, Cambridge.
John D. C. Little.
Oper Res Soc Amer J, Vol 3, No 2, pp 187-197, May 1955. 2 fig, 1 tab, 4 ref.

Descriptors: *Dynamic programming, Reservoir operation, *Hydroelectric power, Markov processes, Computer programs, Mathematical models, Optimization, Operating costs.
Identifiers: Grand Coulee Dam, Columbia River.

Stochastic dynamic programming was used to find operating rules of a reservoir used for hydroelectric production. The objective was to minimize the expected yearly cost. The state variables were current reservoir level and inflows into the reservoir in the preceding interval, the decision variables were the releases from the reservoir, and the stages were the time intervals. Probabilities of inflow were assumed to conform to a simple Markov process. The recursive relation was developed, and a mathematical model of the hydroelectric cost was presented. An example using data from the Grand Coulee Dam on the Columbia River was solved. The system was then operated with historical flow record as input and analyzed. The minima found were sometimes true minima and sometimes corner minima. (Gablinger-Cornell)

PLANNING FLOOD CONTROL MEASURES BY DIGITAL COMPUTER,
University of Kentucky, Lexington.
James N. Cline.
Res Rep No 11, Univ Kentucky, 1968. 313 p, 6 fig, 35 tab, 38 ref. OWRR Project A-001-Ky.

Descriptors: *Computer programs, Computers, Computer models, *Flood control, Analysis, Planning, Economics, Land use, Flood, Flood proofing, Flood protection, Design flood, Costs, Channel improvement, Hydrographs.

The purpose of this study was to develop adequate guidelines for using a pair of digital computer programs known as the University of Kentucky Flood Control Planning Programs to ease the computational burden of evaluating specific flood control situations. Program II determines the economically optimum combination of channel improvement, land use restriction, and flood proofing for flood damage abatement. Program III also incorporates reservoir storage into the planning process. The Programs are not intended to provide a finished design but rather to select the optimum combination of flood control measures and residual flooding with regard to both time and space. Application of Computer Programs to flood control planning is guided by presenting a general description of the application process and a detailed description of the input required and the output produced by the Planning Programs. Input was developed and results interpreted to determine the optimum flood control plan for the upper reaches of the North Fork of the Kentucky River near Hazard, Kentucky.

BEY V WRIGHT PLACE, INC)DAMAGES FOR WATER DISCHARGE ONTO PLAINTIFF'S LAND(.
State of Ohio, Columbus.

160 N E 2d 378-383 (Ct App Ohio 1956) 6 p.

Descriptors: Judicial decisions, *Ohio, Damages, Discharge (Water), Rainfall-runoff relationships, *Runoff, Surface waters, Ditches, Channels, Natural streams, *Sewage, Watercourses (Legal), Wells, Streams, Beds, Banks, Drainage, Riparian rights.

Action was brought for damages resulting from additional waters discharged onto plaintiffs' land by the defendants. The trial court ruled in favor of the plaintiffs, and the court of appeals affirmed. The owner of lower land must accept natural surface drainage from higher land. However, where surface water, when it rained, ran from higher land of the defendants over lower lands of the plaintiffs and then into a ditch, but there was never a watercourse, natural waterway, or other defined channel, the plaintiffs were not required to accept from the defendants' higher land additional water which had been pumped from deep wells, then used for toilets, washrooms, restaurant, and other business uses. This additional water was not surface water and the defendants were liable for damages caused by the additional waters on the land of the plaintiffs. One may not obtain by prescription, or otherwise than by purchase, a right to cast sewage on the lands of another without his consent. (Watson-Fla)

LINCOLN PARK AMUSEMENT CO V TOWN OF WESTPORT)ACTION BY PROPERTY OWNER TO COMPEL TOWN TO REOPEN CULVERT(.
State of Massachusetts, Boston.

159 N E 2d 68-70 (Mass 1959) 3 p.

Descriptors: Judicial decisions, *Massachusetts, *Culverts, Roads, Surface drainage, *Natural streams, Ponds, Rivers, Tributaries, Effluents, Discharge (Water), Streams, Runoff, Flow, Riparian rights, Streamflow, Obstruction to flow.

This was an action by an amusement company to compel the town to reopen and maintain a culvert in good condition. The Supreme Court held that the finding by a master that water had flowed from the plaintiff's pond through the culvert to a tributary of a river from 1908 to 1954 supported the conclusion that the culvert had become a natural watercourse which the town had a duty to keep open. Even if the amusement park had no right to discharge effluent from a sanitation plant into the stream, the town was not justified in obstructing the culvert. However, a property has no right to materially increase the flow of water from his land so as to cause injury to downstream land owners. (Watson-Fla)

FREDERICK V UNION CARBIDE CORP)LIABILITY FOR FLOOD DAMAGE(.
State of West Virginia, Charleston.

168 F Supp 808-811 (D C W Va 1959).

Descriptors: *West Virginia, *Judicial decisions, Water law, *Flood damage, Flood gates, *Negligent inundation, Streams, Culvert, Flooding, Damage, Water law.
Identifiers: Act of God.

Plaintiffs allege that defendant's negligence in maintaining an improper floodgate and wire mesh fence over a stream impeded the flow of debris-carrying flood waters, causing the waters to dam up and rise into plaintiff's store. After defendant removed the flood gate and changed the location of the fence, subsequent floods of similar intensity failed to cause any backing up. The court held the flood not to be an act of God because reasonable human foresight, pains and care could have prevented the result. To relieve from liability, the act of God must be the sole and proximate cause of the injury. Defendant was held to be negligent because he failed to fulfill his duty which was stated as 'the exercise of reasonable care in the maintenance of a culvert (have a floodgate and fence) commensurate with size of the watercourse and with the area and character of the country that it must naturally drain.' (Childs-Fla)
W69-01282

RIVER DEVELOPMENT CORP V LIBERTY CORP)SUBAQUEOUS LAND RECLAMATION(.
State of New Jersey, Trenton.

29 N J 239, 148 A 2d 721-722 (1959).

Descriptors: *New Jersey, Judicial decisions, River beds, *Land reclamation, Legislation, Permits, *Ownership of beds.

Plaintiff held a statutory authorization or license to reclaim subaqueous land of a river and sought to enjoin the defendant from conducting dredging operations in the river. Since the license to reclaim the land had remained unexercised for a period of 86 years, any rights thereunder are held to have expired. Mere non-use is not sufficient to sustain a finding of abandonment. It is unreasonable to assume that the license to reclaim conferred a vested right in perpetuity in the subaqueous lands. By implication of law it must be assumed that the parties intended the receiver of the license to reclaim and acquire actual ownership of the fee within a reasonable time. (Molica-Fla)

JOHNSTON V MILLER)ACCELERATED FLOW OF SURFACE WATER(.
State of Ohio, Columbus.

240 NE 2d 566-569 (Ct App Ohio 1968).

Descriptors: Judicial decisions, *Ohio, Damages, Tile drainage, Surface waters, *Drainage systems, *Erosion, Washouts, Natural flow.

In the lower court the plaintiff won damages and an injunction on the ground that the drainage system installed by the defendants had concentrated, diverted, and accelerated the flow of surface water across the plaintiff's land causing washout and erosion. The court of appeals held that whether or not surface water flowed naturally from the defendant's land or was diverted and concentrated by a tiling system was a jury question, and it would not reverse the decision of the jury. The court of appeals also stated that an upper land owner cannot lawfully increase the burden on lower lands by collecting surface water and discharging it in larger quantities and at points other than those established by natural drainage. (Watson-Fla)
W69-01286

DIMMOCK V CITY OF NEW LONDON)WRONGFUL DIVERSION OF WATER FROM BROOK(.
State of Connecticut, Hartford.

245 A 2d 569-574 (Conn 1968). 6 p.

Descriptors: Judicial decisions, *Connecticut, Damages, Streams, Diversion, *Riparian rights, Streamflow, Ponds, Channels, Water quality, *Natural flow doctrine, Prescriptive rights, Invasion, Reservoirs.
Identifiers: Injunction, Equity.

The city successfully defended this action for injunction and damages in the trial court. On appeal it was reversed in favor of the plaintiff. This court held that a riparian owner is entitled to the natural flow of the water of a stream through or along his land, in its accustomed channel, undiminished in quantity and unimpaired in quality. Regardless of any perceptible, actual damage which a lower riparian plaintiff may be able to prove resulted from a wrongful diversion by an upstream defendant, such a diversion is an invasion of the rights of the plaintiff. If the invasion was continued for a period of 15 years it would confer a prescriptive right upon the defendant to divert the stream. Because the diversion of the water was necessary to supplement the public water supply and the plaintiff's damages were found to be nominal by the trial court, an injunction was granted and the city was allowed a reasonable time to make adequate compensation to the plaintiff. (Watson-Fla)

LIABILITY OF LANDOWNER FOR DAMAGES CAUSED BY OVERFLOW, SEE PAGE, OR THE LIKE RESULTING FROM DEFECT IN ARTIFICIAL UNDERGROUND DRAIN, CONDUIT, OR PIPE,
W. R. Habeeb.
44 ALR 2d 960-972.

Descriptors: Damages, Flood damage, *Subsurface drainage, *Subsurface drains, Conduits, Pipes, *Legal aspects, Artificial watercourses, Surface drainage, *Obstruction to flow, Construction.
Identifiers: Defective construction, *Ordinary care.

Jurisdictions were divided on the liability of landowners for damage resulting from defects in artificial underground drains, conduits, or pipes. Decisions ranged from directed verdicts for either plaintiff or defendant. A number of jurisdictions held defendant to a duty of ordinary care, a question of fact, to see that no injury came to adjacent property owners. The general rule seems to be that a defendant landowner, whether upper, dominant, or controlling, or lower or servient, is liable for damage to adjacent property owner's land as a result of defective construction of artificial drains. An exception was when damages arose from extraordinary and unprecedented flows. City property owners may protect their land from surface water flowing from adjacent land, even if it involved obstructing an artificial drain. (Sisserson-Fla)
W69-01292

WHEN STATUTE OF LIMITATION COMMENCES TO RUN AGAINST DAMAGE FROM OVERFLOW OF LAND CAUSED BY ARTIFICIAL CONSTRUCTION OR OBSTRUCTION,
E. H. Schopler.
5 ALR 2d 302-386.

Descriptors: *Judicial decisions, Obstruction to flow, Waterway, *Overflow, Flood damage, Drainage systems, *Legislation, *Natural flow, Eminent domain, Louisiana, Massachusetts, Embankments, Public utility, Cities, Railroads.
Identifiers: Statute of limitations.

Two questions are presented concerning damage caused to land by artificial construction or obstruction which results in overflow: (1) when does the statute of limitations start to run; and (2) for what part of the cause of action does it run. Permanent and continuing injuries are distinguished as to their effect in starting the limitation period. The permancy, lawfulness, negligence in construction, and removability of the obstruction are all factors in classifying the injury for purposes of determining the beginning of the limitation period. Four characteristic groups of cases are distinguished. The first two groups are concerned with whether the limitation period begins when the obstruction is completed or when, after such completion, injury caused by overflow becomes manifest. The last two groups of cases deal with circumstances by which successive injuries begin the limitation period for the entire cause of action or only for separate causes as and when they accrue. There is disagreement as to when the limitation period begins for acts by municipalities, improvement districts, private individuals or corporations or railroads. (Childs-Fla)

AN ACT TO AMEND...AN ACT CONCERNING THE ESTABLISHMENT, DEVELOPMENT AND OPERATION OF PUBLIC PORTS, CREATING THE INDIANA PORT COMMISSION AND DEFINING ITS POWERS AND DUTIES.
State of Indiana, Indianapolis.

Indiana Laws Ch 210 (1967).

Descriptors: *Indiana, Legislation, *Port authorities, Harbors, Navigation, *Canal construction, Repairing, Condemnation, Cost repayment, Project planning, Administrative agencies, Public benefits.

This Act is an addition to chapter 11 of the Acts of the Indiana General Assembly for the year 1961. It adds to and defines new powers of the Indiana Port Commission. The commission is authorized to construct new canals, and repair and improve existing canals and waterways for the purpose of connecting ports under the commission's jurisdiction with other such waterways. The commission is not authorized to condemn any existing property right and is required to reimburse any public or private facilities for damage resulting from construction or repair of canals. (Sisserson-Fla)
W69-01303

AN ACT...TO CHANGE THE DEFINITION OF WATERS..., TO CHANGE THE DEFINITION OF POLLUTION, TO EXEMPT TIDAL WATERS..., CERTAIN DRAINAGE SYSTEMS FROM THE PERMIT REQUIREMENTS.
State of Maryland, Annapolis.

Maryland Laws ch 416 (1967).

Descriptors: *Maryland, Legislation, Administrative agencies, *Permits, Reservoirs, Dams, Obstruction to flow, Construction, Repairing, *Water pollution, Tidal waters, Drainage systems, Administration.
Identifiers: *Public hearings.

This Act repealed and re-enacted, with amendments, sections 2 (E), (G), 12 (A) and 15 of Article 96A of the Annotated Code of Maryland (1966 Supplement), title 'Water Resources', subtitles 'General Provisions' and 'Appropriation of Waters, Reservoirs and Dams.' 'Waters of the State' and pollution are defined. It is unlawful for anyone to construct or repair a reservoir, dam or water obstruction without a permit from the Department of Water Resources. Excepted from this requirement are: dams and obstructions under ten feet in height; reservoirs with a storage capacity of less than one million gallons; reservoirs constructed under a permit of the State Department of Health; structures impounding waters less than four feet in depth for the propagation of wildlife species; and drainage systems designed for collection, conveyance and

disposal of storm water. Public hearings are mandatory for permit applications to alter, in any manner, the course of any waters of the state. (Sisserson-Fla)

BACORN V STATE)OWNERSHIP OF NAVIGABLE RIVER BED(.

20 Misc 2d 369, 195 N Y S 2d 214-220 (1959).

Descriptors: Judicial decisions, *New York, *Ownership of beds, *Navigable rivers, Flood control, State jurisdiction.

Claimants brought suit against the state to recover money judgments for lands which they claimed were owned by them and were taken by the state without compensation. The state published notice of its taking of perpetual easements in two parcels of land on the Chemung River, for the purpose of the 'Elmira Flood Protection Project.' The state contended that the river was navigable and that its activities were restricted to the river bed. The claimants contended that the river had not been used for navigation for years and that even if it was a navigable river, the state's action had no relation to navigation. The Court of Claims found that the river was navigable and that the state had merely exercised public powers over public waters for which private interests must yield without compensation. The state's power is not restricted to regulation of navigation. Claimants failed to establish that the parcels were not in the river bed and the fact that such parcels were not subject to a continuous flow of water did not establish that they belonged to claimants through accretion. (R.F. Williams-Fla)

OWNERSHIP AND CONTROL OF WATER BOTTOMS AND CONTROL OF THE SHELLFISH INDUSTRY.
La RS 56: 421, 424, 425, 495 (1965).

Descriptors: *Louisiana, Legislation, *Administrative agencies, *Commercial fishing, Shellfish, *Ownership of beds, Rivers, Lakes, Bays, Gulf of Mexico, State governments, Judicial decisions, Leases, Coasts.
Identifiers: Bi-valve industries.

The bottoms of bodies of water bordering on or connected with the Gulf of Mexico and all shellfish grown thereon are the property of the state. No conveyance of these bottoms can be made by any political official. The leasing of waters for mineral purposes is not affected. Water bottoms and natural reefs in waters of this state may be leased. No claim to any water bottoms suitable for oyster culture is valid until adjudicated as to the question of title. No lease of bedding grounds lawfully made before July 27, 1932, is affected by this act. Owners of expiring leases have first right of renewal. The methods for granting leases to water bottoms and the regulations applicable after such lease has been made are provided by this act. The waters of Louisiana for purposes of the act are classified as either inside or outside waters. The pertinent factors for this classification are stated. This act is annotated. (Childs-Fla)
W69-01320

UNITED STATES V MCFADDEN)ACTION TO QUIET TITLE(.

171 F Supp 628-631 (D C Ky 1959).

Descriptors: *Kentucky, United States, Judicial decisions, Real property, *Land tenure.

The United States brought an action to quiet title to a tract of land. Defendants, by counterclaim, sought to have title to a five acre portion of the tract quieted in them. At issue was the line between the government land and defendant's land. The deed to the government land called for the boundaries to follow the meanders of a stream. The defendant's deed called for a boundary in courses and distances. There was conflict between these two boundaries. Under Kentucky law, where a deed calls for the meanders of a stream as a boundary they must be followed and the courses and distances yield to the winding path of the stream where there is conflict. Thus, the United States was entitled to a judgment quieting title in it. (Childs-Fla)

COUNTY BOARD OF SUPERVISORS FOR MECOSTA COUNTY V DEPARTMENT OF CONSERVATION)TO ENJOIN LOWERING OF RESERVOIR LEVEL(.
160 N W 2d 909-927 (Mich 1968) 19 p.

Descriptors: Judicial decisions, *Michigan, Reservoirs, Administrative agencies, Lakes, Streams, *Water levels, Wildlife habitats, Riparian land, Riparian rights, Flow, Easements, Flooding, Legislation, Conservation, *Dams, Fishing, Navigable waters, Impoundments.

The Supreme Court of Michigan ruled that an attempt by riparian owners to enjoin court determination of the height of an artificial lake was properly dismissed. The legislature did not intend to preclude the county supervisors from proceeding to have established the normal level of the lake which resulted from the construction and maintenance of a dam. The conservation department had acquired approximately two-thirds of all the riparian land involved and the remaining riparian owners had granted flowage easements to the state and had authorized the use of the water of the flooded area for public purpose. Therefore the action by the riparian owners to enjoin the conservation department from lowering the normal level by some 18 in. was properly dismissed. (R. H. Watson-Fla)
W69-01327

MODERN STATUS OF RULES GOVERNING INTERFERENCE WITH DRAINAGE OF SURFACE WATERS,
W. E. Shipley.
59 ALR 2d 421-445.

Descriptors: *Surface drainage, *Drainage water, *Legal aspects, Land tenure, *Reasonable use, Relative rights, Obstruction to flow, Natural flow doctrine, Competing uses, Repulsion (Legal aspects), Civil law.

There were originally two basic rules applied by the courts in cases involving drainage of surface waters. The common enemy doctrine allowed the landowner to do anything he pleased on his own land in dealing with the disposal of surface water drainage, without liability to adjoining landowners. The civil law rule, on the contrary, allowed no interference with the natural course of water drainage by landowners, and also prohibited artificial removal or increase of the water drainage. Both of these extreme views have been modified over the years. The tort principles of reasonable use and negligence have been applied by several states. Some courts have abandoned both rules and have adopted a third rule, the reasonable use doctrine, where the rights of the parties are determined by assessing all the relevant factors. These doctrines are most frequently called into use when the lower landowner dams back water, a landowner augments natural drainage, or when there are conflicts over the collection and discharge of water. (Sisserson-Fla)
W69-01329

RIGHT OF RIPARIAN OWNER TO CONSTRUCT DIKES, EMBANKMENTS, OR OTHER STRUCTURES NECESSARY TO MAINTAIN OR RESTORE BANK OF STREAM OR TO PREVENT FLOOD.
23 ALR 2d 750-761.

Descriptors: *Embankments, *Riparian land, *Riparian rights, Floods, Flooding, Flood damage, Dikes, Levees, Natural streams, Watercourses (Legal), Banks, Water law, Legal aspects, Judicial decisions.

The annotation discusses the right of a riparian owner on a natural watercourse to construct embankments along his bank of the stream to protect his land. The general rule is that he does not have that right if the embankment constructed will cause ordinary flood waters to damage the lands of others. Some jurisdictions allow the construction of protective embankments and some jurisdictions hold that flood waters are surface waters and a common enemy against which a riparian owner may fight. The general rule only applies to damage to the land of others which is caused by ordinary flooding. If the embankment would not cause damage to another's land in times of ordinary flooding but would only in case of an extraordinary flood the embankment would be allowed. (Horner-Fla)

105-1407 WATERCOURSES: DIVERSION, OBSTRUCTION, OR POLLUTION AS CONSTITUTING TRESPASS 105-1408 UNDERGROUND STREAMS, INTERFERENCE WITH.
105 Ga Code Ann secs 105-1407, 105-1408 (1967).

Descriptors: *Georgia, Legislation, *Riparian rights, Alteration of flow, Diversion, Obstruction to flow, Reasonable use, *Natural flow doctrine, Streams, *Underground streams, Water law, Legal aspects, Non-navigable waters, Overlying proprietor.

Sec 105-1407 provides that a riparian owner on a non-navigable watercourse is entitled to have its water come to his land in its natural and usual flow, subject only to reasonable use by other riparian owners. Diversion, obstruction or pollution of the stream, impeding its flow, causing it to overflow, or diminishing its value and thus causing injury to riparian land or a right appurtenant thereto, shall be a trespass to such riparian land. Sec 105-1408 provides that since the course of an underground stream and its condition before its first use are so difficult to ascertain, trespass may not be brought for alleged interference with the rights of an overlying proprietor. (R. F. Williams-Fla)
W69-01334

STANDARDS OIL CO)INDIANA(V JOINT BOARD OF SUPERVISORS OF HARRISON AND MONONA CTYS)EXPENSES OF

RELOCATING PIPES NECESSITATED BY CHANGE IN DRAINAGE CHANNEL(.
State of Iowa, Des Moines.

94 N W 2d 312-321 (Iowa 1959) 10 p.

Descriptors: Judicial decisions, *Iowa, Channels, Administrative agencies, Drainage, *Ditches, *Pipelines, Drainage districts, Rivers, Permits.

Standard Oil sued the board to recover expenses incurred in relocating a pipeline necessitated by a change in a drainage channel by the district. An award was made in the lower court, but the supreme court reversed because the pipeline company, in application to the board of trustees of the drainage district for a permit to construct pipe line across the drainage ditch, had voluntarily offered to bear any expenses of relocating its pipeline necessitated by a change in the location of the drainage ditch. The pipeline company could not avoid its obligation to pay the expenses on the ground that the trustees were without power to accept the conditions. (Watson-Fla)
W69-01339

BELL V UNION ELECTRIC CO)FLOOD DAMAGE CAUSED BY DAM(.
367 S W 2d 812-822 (K C Ct App Mo 1963).

Descriptors: *Flooding, *Flood damage, Flood gates, *Floods flow, Riparian land, Dams, Real property, Water levels.
Identifiers: Flow retardation, Trespass.

The plaintiff claimed that a dam owned and operated by the defendant caused the flooding of his property and damage to his crops. The trial court found that where the flows of a river were retarded because of silt caused by a dam, and the presence of a lake held by the dam retarded the flow of the river and the operation of the floodgates of the dam and these factors combined to cause the flood waters going upon the plaintiffs' land, the dam owner is liable for damages caused by the flood. The court of appeals affirmed noting that the action was in the nature of a trespass and not negligence. (Horner-Fla)
W69-01349

TRUSTEES OF THE INTERNAL IMPROVEMENT FUND V VENETIAN ISLES DEV CORP)PERMIT TO DREDGE AND FILL(.

166 So 2d 765-768 (1 Dist Ct App Fla 1964).

Descriptors: *Florida, *Beds, *Administrative agencies, *Permits, Dredging, Bulkheads, Legal aspects.

The plaintiff corporation was issued a permit to dredge and fill certain bottomlands by the Pinellas County Water and Navigation Authority. The permit had been approved by the Trustees of the Internal Improvement Fund. Latter, the corporation filed an application with the Authority for an extension of the permit completion time. The Authority voted to extend the completion time. The Trustees never approved the extension and the plaintiff instituted action to determine the rights of the parties. The court held that the Authority properly exercised its powers in extending the permit, and, after doing so, its right to act ceased. The Trustees did not have the power to exercise independent judgment in this case and they were ordered to approve the extension. (Horner-Fla)
W69-01352

VOLKERDING V BROOKS)ACCRETION AND ADVERSE POSSESSION IN MISSOURI(.
359 S W 2d 736-743 (1962).

Descriptors: *Missouri, *Accretion (Legal aspects), *Boundaries (Property), Riparian rights, Riparian land, Water law, Judicial decisions.
Identifiers: Adverse possession.

In an action to quiet title, the trail court held for the plaintiff as against the defendant's answers of title by adverse possession and by reason of accretion. However, on appeal, the court in the instant case reversed as to the issue of title by reason of accretion. The court stated that the law governing the matter held a riparian owner to own to the low water mark on navigable streams. Riparian ownership is essential to ownership of accretions, ie, accretions depend upon actual contiguity, without any separation of the claimant's land from the accumulated alluvion by the lands of another. A corollary of this rule is that if the shore lines of two bodies of land, such as islands, are divided by a watercourse, then receive accretions until the shorelines come together, the line of contact will be the division line. The court remanded the case because the evidence presented by the plaintiff was not sufficient to establish that his property extended to the water's edge. (Patterson-Fla)
W69-01363

BLACK V CLARY)ACCRETION AND ADVERSE POSSESSION IN ARKANSAS(.

364 S W 2d 528-530 (1963).

Descriptors: *Arkansas, *Accretion (Legal aspects), Legal aspects, *Boundaries (Property), Riparian land, Judicial decisions.
Identifiers: *Adverse possession.

In affirming a ruling of the trial court judge enjoining the defendant from trespassing on the plaintiff's accreted lands, quieting title in the plaintiff and awarding damages, the court in the instant case stated that the result was justified on the basis of acquisition by accretion and by adverse possession. Upon reviewing the record as a whole, the court found that the plaintiff's possession had been both adverse and continuous for a period of seven years. It was also stated that notice of adverse possessions may be actual or inferred from facts and circumstances. (Patterson-Fla)
W69-01364

PEOPLE V SPENCER)TITLE TO ACCRETED LAND(.

5 Mich App 1, 145 N W 2d 812-816, (Ct App Div 3 Mich 1966).

Descriptors: *Accretion (Legal aspects), *Boundaries (Property), Judicial decisions, Water law, Legal aspects, *Michigan.

This was an action to determine title to certain lands built up by accretion. During the time that the accretion was taking place on the two adjoining lakefront lots, both were owned by the same person. Subsequent to the accretion, part of the two lots was dedicated to the state as a public park, and the remainder was sold to the defendant. In Michigan, where the boundary of a piece of property is a shoreline, the shoreline is the boundary notwithstanding its subsequent recession or advancement. Where title to two lots was in a common owner, and the lots were added to by accretion, the common grantor may convey the new land without adherence to the new boundary established by accretion. The court held here that the grantor's intent controlled, and that the grantor intended to convey the accreted land to the defendant, hence relief was denied. (Batchelor-Fla)
W69-01372

BOROUGH OF WILDWOOD CREST V MASCIARELLA)TITLE TO ACCRETED LAND(.
222 A 2d 138-145 (Super Ct N J 1966). 92 N J Super 53.

Descriptors: *Accretion (Legal aspects), Bank erosion, Boundaries (Property), Water law, Legal aspects, Judicial decisions, *New Jersey.

This case deals with the question of whether the State or upland owners are entitled to gradual and imperceptible accretion. The court discusses the proposition that the owner of lands along the sea is obliged to accept the alterations of his boundaries. A distinction is then drawn between accretion by natural forces, and that which is artificially caused. While recognizing that natural accretion inures to the benefit of upland owners the court treats this as a case of first impression as to artificial accretion. After a discussion of authorities in other jurisdictions the court concludes that the better rule is that the alluvion formed by gradual and imperceptible accretion, whether caused in whole or in part by artificial means, inures to the benefit of the upland owner. Finally the court places two limitations on this rule. The first restriction applies when the artificial accretions are caused solely by the act of the upland owner. The record involves projects by a governmental agency in the aid of navigation. (Batchelor-Fla)
W69-01373

JONES V WILLIAMSON)DRAINAGE EASEMENT(.
220 N E 2d 645-648 (3d Dist Ct App 111 1966). 74 111 App 2d 367.

Descriptors: *Easements, Legal aspects, Water law, Ditches, Diversion structures, Surface drainage, *Surface runoff, Drainage water, *Illinois.

This case deals with the construction of a drainage ditch to dispose of surface water runoff. The upland owner and the adjoining lower land owner agreed orally to the construction of this ditch. The lower land was then sold to Jones, who had no knowledge of the agreement. Jones now seeks to enjoin the upland owner from discharging surface water from the diversion ditch onto the lower property. It is acknowledged that an upland owner does not have a right to discharge water from a ditch onto lower land merely because he is the owner of upper land. The court then goes into the application of an 111 statute pertaining to construction of drainage ditches by mutual consent of the owners. The case holds that where a drainage ditch, constructed by mutual agreement, forms a continuous line across adjoining lands a perpetual easement exists on such lands. It is further held that where there are open visible marks of a drainage ditch easement the purchaser has a duty of inquiry and is bound by such easement. (Batchelor-Fla)

FREESTATE INDUSTRIAL DEVELOPMENT CO V T AND H INC)OBSTRUCTION TO NATURAL FLOW OF SURFACE WATERS(.
188 So 2d 746 (La Ct App 1966).

Descriptors: *Remedies, *Louisiana, *Surface drainage, Construction, *Alteration of flow, Relative rights, Adjudication procedure, Natural flow doctrine, Legislation.

Plaintiff sought injunctive relief to prohibit defendant from altering the natural flow of surface drainage so as to cause drainage from defendant's property to flow upon plaintiff's property. In the alternative plaintiff prayed for compensatory damage. Prior to April, 1964 there was a ridge on defendant's property near the common boundary line of plaintiff's property which caused the major portion of surface drainage to flow away from plaintiff's land. Subsequently defendant made improvements on his property which plaintiff alleges caused surface water to flow onto his property. The lower court dismissed plaintiff's alternative demand for damages because the prescriptive period of one year had lapsed. This court reversed and remanded holding that plaintiff sought damages only in the event that injunction was denied. It is an established principle in Louisiana that compensatory damages may be awarded in lieu of injunctive relief. Such damages are not subject to the prescriptive period found in Articles 3536 and 3537 of the Louisiana Revised Civil Code. (Kahle-Fla)

W69-01376

CLEMONES V ALABAMA POWER CO)FLOODING CAUSED BY DAM CONSTRUCTION(.
250 F Supp 433-439 (N D Ga 1966).

Descriptors: *Georgia, Legal aspects, Judicial decisions, *Flood damage, Backwater, Dams, Reservoirs, Rain, Excessive precipitation, Floods, Public utilities.
Identifiers: Act of God.

This is an action for damages against an electric utility for the flooding of plaintiff's property behind the utility's recently constructed reservoir after heavy rains. The facts showed that the defendant had made a detailed study of flooding in the area prior to the construction of the facility and this gave them a reasonable warning of the likely recurrence of flooding. Consequently, under Georgia law the heavy rains which transpired were not so extraordinary as to free the defendant of all liability. The acts and omissions of the defendant constitute a trespass by human agency even though coupled with acts of God. As a trespasser the defendant is liable for harm caused by it, and this liability is the apportioned amount of damage to the plaintiff not caused by the act of God. (P. N. Smith-Fla)
W69-01382

IN RE BUREAU OF WATER SUPPLY)RESERVOIRS AND NATURAL FLOW(.

219 A 2d 409-413 (N J 1966).

Descriptors: Rivers, Navigable waters, Salinity, Utilities, *Water utilization, *Water quality, Wastes, Flow control, Reservoirs, Contracts.
Identifiers: Minimum flow rate.

In 1918, New Jersey approved the application of the water company to divert water from state rivers, subject to the condition that if it became necessary to provide storage of storm waters to supply consumers the expense would be apportioned among the consumers using water from the rivers. Subsequently, reservoirs were built to hold storm waters in order to provide minimum flow rates in the rivers and to supply consumer needs. The petitioner, water company, contended that the 1918 grant was a franchise which gave it a vested interest in the water and that it should not have to pay a portion of the cost of the reservoirs and that if it did have to pay, the amount should be reduced by the portion of the project that went toward maintaining minimum flow rates. The court held that the petitioner had agreed to pay a proportion of the cost of the reservoirs and that the maintenance of minimum flow rates benefited the water consumers by keeping the rivers clean and reduced salinity. (Horner-Fla)
W69-01387

ROBINSON V HUMBLE OIL AND REFINING CO)EFFECT IN CHANGE IN LOCATION OF STREAMBED ON BOUNDARY(.

176 So 2d 307-319 (Miss 1965).

Descriptors: *Accretion (Legal aspects), *Avulsion, Boundaries (Property), Real property, Meanders, Channels, Alluvial channels, Erosion, Riparian rights, Riparian land, Water law, Legal aspects.
Identifiers: Evidence, Proof of facts.

The litigation concerned the title to a parcel of land situated between the old and the present bed of a stream. The stream was the original boundary between the land of the complaintant and that of the defendant. The complaintant alleged that the change in the stream was by avulsion and therefore the boundary did not change from the old stream bed. The court held that the evidence supported the chancellor's conclusion that the change was caused by accretion and that the boundary changed with the stream. The owners of land bounded by a stream own to the thread of the current of the stream; but the boundary shifts with gradual non-avulsive changes in the stream. In the absence of countervailing evidence, the presumption of gradual erosion and accretion prevails when the lay of the land, the length of elapsed time as related to the distances of the movement and the general correspondence of the location and directions of the river at the later period as compared with that of the earlier, are such that the stated presumption may be reasonably entertained. (Horner-Fla)
W69-01391

PADGETT V CENTRAL AND S FLA FLOOD CON DIST)EFFECT OF LOWERING WATER LEVEL ON RIPARIAN TITLE(.

178 So 2d 900-905 (2 DCA Fla 1965).

Descriptors: *Florida, *Accretion (Legal aspects), Riparian rights, Riparian land, Boundaries (Property), Real property, High-water mark, Banks, Lakes, Water levels, Levees.

The controversy involves the rights of the defendant landowner whose property was situated on the bank of Lake Okeechobee until the state lowered the level of the lake thereby leaving a strip of land between the property and the lake. The state constructed a levee on that strip of land thereby depriving the plaintiff of access to and a view of the lake. The land presently belonging to the defendant was reclaimed land which had originally belonged to the state. The court held that the statute authorizing the conveyance to the defendant gave the state the right to change the status of the defendants lands so that they would no longer be lands with riparian rights. Where the state causes the level of a navigable lake to be lowered and thereby uncover lands below the original high water mark, lands so uncovered continue to belong to the state and do not vest in the riparian owner through the doctrine of accretion. (Horner-Fla)

NEW YORK STATE MUNICIPAL WATER AND SEWAGE,
R. D. Hennigan.
Water Sewage Works, Vol 110, No 12, pp 448-52, Dec 1963.

Descriptors: *Planning, Construction, *Legislation, Grants.
Identifiers: *Storm sewers, Urban drainage, New York.

The need for a unified approach to the planning, construction, and operation of all water utility services is stressed. In particular, water service, sewer service, and storm drainage projects should be planned on an integrated basis. New York State laws and constitutional changes have been designed to encourage an integrated approach to the planning of water and sewage works. Recent legislation relating to such planning is described. One provision would enable municipalities to obtain 100% support for approved comprehensive sewer and water studies. The author observes that 'counties are increasingly becoming the focus for providing area-wide water and sewer facilities.' A brief listing of sources of fiscal aid is included.

ATTENUATION OF FLOOD WAVES IN PART FULL PIPES,
P. Ackers, and A. J. M. Harrison.
Proc Instn Civ Engrs, Vol 28, pap No 6777, pp 361-381, 1964.

Descriptors: Pipes, *Hydrographs, *Floods, *Conduits.
Identifiers: Storm sewers.

In the derivation of improved methods for designing storm-water drainage systems it is important to know the way in which the flood hydrograph (or flood wave) is modified as it passes along a conduit under conditions of free surface flow; and an extensive study was therefore carried out using an experimental pipeline installation in which the slope, height, and length of peak of the input hydrograph could be varied. For each set of conditions, depth-time data were automatically recorded and analysed in terms of dimensionless parameters showing that the rate of lowering of the wave peak with time and with distance is a function of the pipe diameter, the Froude number, the depth of base flow, and the volume of fluid in the wave. The volume of the wave, not its shape, is the principal factor affecting the attenuation. The velocity of the peak of the wave was found to be in good agreement with the Kleitz-Seddon law. The peak depth of the wave is a function of the peak discharge which is related to the steepness of the wave, but in most practical cases differs little from the normal discharge. As dimensionless parameters were used the results are applicable to storm sewers of all diameters and floods of all durations and magnitudes, provided the hydrograph is not steeper than those studied.

4B. Groundwater Management

ECONOMIC CONTROL OF GROUNDWATER RESERVES,
Missouri Univ., Columbia.
Oscar R. Burt.
J Farm Econ, Vol 48, No 3 Part 1, pp 632-647, Aug 1966. 1 fig, 14 ref.

Descriptors: *Dynamic programming, Aquifers, Distribution patterns, Synthetic hydrology, Water balance, Water allocation (Policy), Public benefits, Economic efficiency, Markov processes, Groundwater recharge, Groundwater mining, Pumping, Marginal return.
Identifiers: Present value.

Sequential decision theory was used to develop a framework for derivation of optimal groundwater policies focused on temporal allocation. The functional equation was derived from a dynamic programming formulation of the problem. The primary criterion of choice was expected present value of net output from the basin, and dispersion of net output is introduced as a secondary consideration. The expected-present-value function and its associated rate-of-use function under an optimal policy were discussed, assuming that some form of 'the 'use' tax method' could be applied to assure that the value-marginal-product function of the producers equalled the marginal-social-benefit function. The decision variables, the rates of use from stock, were functions of the storage level, time, and the rate of recharge, a random variable. Only discrete values of rates of use and storage were permitted. A Markov process analysis of groundwater stocks was presented. (Gysi-Cornell)

SPERRY RAND CORP V WATER RESOURCES COMM'N)REMEDY FOR DAMAGE TO GROUNDWATER SUPPLY(.

291 N Y S 2d 716-718 (Sup Ct 1968).

Descriptors: *New York, *Administrative decisions, *Well permits, Water law, Judicial decisions, Legislation, Water supply.
Identifiers: *N Y Water Resources Commission, Public interest.

The petitioner Sperry Rand Corporation seeks in this action an annulment of a determination of the New York Water Resources Commission permitting a landowner adjacent to the petitioner to utilize well water in a certain way. In granting the application of the adjacent landowner to sink the well in question, the Commission found that the petitioner might thereby be damaged; and the question in this case is whether the Commission must either refuse an application or impose protective conditions when a proposed use will have an adverse effect upon an adjoining owner. The court held that although such an adverse effect should be a factor for the Commission's consideration, its concern by statute was primarily with the public interest and not with the competing interests of two adjacent landowners. Redress for grievances between such landowners should be found in litigation interse se. (Patterson-Fla)

ADAMS V GRIGSBY)INTERFERENCE WITH GROUNDWATER SUPPLY(.

152 So 2d 619-624 (La 1963).

Descriptors: *Groundwater, Wells, *Louisiana, Judicial decisions, Legislation, Percolating waters, Damage, Relative rights, Pumping, Groundwater mining, *Overlying proprietor, Water sources, Water supply, *Water wells, Draw down.
Identifiers: Injunction, English rule, Damages (Legal aspects), American rule, *Fugitive substances.

This was an action by residential property owners, who obtained water from a common underground source, for an injunction and damages against defendant for alleged wrongful depletion of the water supply by excessive pumping. Defendant sunk wells and pumped large quantities of subterranean fresh water for use in his oil recovery operations. The court denied plaintiffs' claims. The court rejected plaintiff's contention that underground waters were covered by articles of the Louisiana Civil Code dealing with drainage and the use of running water. The court held that groundwater, like oil and gas, is a fugitive substance, and hence belongs to whoever captures and makes use of it. Hence plaintiffs have no cause of action where defendant, by pumping groundwater from wells on his own land, reduces plaintiffs' supply from the common underground source. The court rejected both the English Rule, (owner owns and may use ground water, but not so as to injure his neighbor) and the American Rule (correlative rights). The court indicated that had defendant wasted the water, relief would have been granted. (Kirkconnell-Fla)

Identifiers: *Pumping, Groundwater depth, Formulas, Pumping tests, Groundwater movement.

Lowering of the water table caused by pump operation can be estimated in terms of drawdown at a corner of a rectangle over which the pumping is uniformly distributed. A chart gives the drawdown at a corner in terms of the width to length ratio and a dimensionless parameter involving the length, aquifer constant, and time. Drawdown at selected points either inside or outside the area of interest can be estimated by adding, or adding and subtracting, the drawdown produced by pumping over suitably chosen rectangles. A pumped area of irregular shape can be represented approximately by the sum of rectangles. To determine total drawdown at a selected well, the drawdown produced by the well discussed in this paper must be added to the drawdown produced by distributed pumping. (USBR)

4C. Effects on Water OF Man's Non-Water Activities

BAYSHORE V STECKLOFF)RIGHT TO FILL BAY FRONT LOTS(.
State of Florida, Tallahassee.

107 So 2d 171-175 (3d D C A Fla 1958).

Descriptors: *Florida, Judicial decisions, Legislation, Riparian rights, Ownership of beds, *Landfills, *Bulkheads, *Coastlines, Beds, Shores, Bays.

Plaintiffs and defendants have adjoining bay front lots. Plaintiffs' lots were filled in and bulkheaded. Subsequently, defendants sought to fill in and bulkhead their lots as permitted under Fla Stat sec 271.01 (1955). Plaintiffs sought a declaratory decree to prevent defendants' action, which would close off the south waterfront side of their lots, on the basis of ch 57-362, Laws of Fla, which repealed the 1955 statute and on the grounds that they have acquired riparian rights on the lateral sides of their lots. The question of whether plaintiffs have acquired riparian rights on the lateral sides of the filled land does not need to be answered because the defendants are also entitled to fill in their lots pursuant to the 1955 statute. By provision the defendants are exempted from the effect of the 1957 statute. (Molica-Fla)

U S V HARRISON COUNTY, MISSISSIPPI)SUIT BY U S TO END DISCRIMINATION AT PUBLIC BEACH BUILT WITH FEDERAL GRANT(.
399 F 2d 485-492 (5th Cir 1968). 8 p.

Descriptors: Judicial decisions, *Mississippi, Beaches, Sands, *Recreational facilities, Sea walls, Grants, *Federal government, Financing, Accretion (Legal aspects), Littoral, Riparian land.
Identifiers: Injunction, Artificial accretion.

The court of appeals reversed the trial court and held that a sand beach and sea walls built with aid of federal funds must be available to all of the general public because it was so stipulated in the contract. The decision of the Mississippi Supreme Court that artificially made sand beaches belonged to the owner of the adjacent property by artificial accretion was held not to be res judicata as to the rights of the U S in this case. The circuit court of appeals in this case held that the Miss Constitutional provision that lands belonging to the state shall never be donated to private persons superseded and abrogated the common law doctrine of artificial accretion. In dicta the court stated that the use of publicly owned beaches is subject to reasonable regulations by the state in exercise of its police powers and such public use must be enjoined in compliance with all valid laws of the state. Also that public use of beaches cannot unreasonably interfere with the littoral rights of the adjoining landowners. (Watson-Fla)

TAKING OF LAND, ETC., FOR PUBLIC ACCESS FACILITIES, ETC., TO COASTAL WATERS AND GREAT PONDS.
State of Massachusetts, Boston.

Mass Ann Laws Ch 21, Sec 17A (1967).

Descriptors: *Legislation, *Massachusetts, Coasts, Great ponds, Administrative agencies, Natural resources, Recreation, Parks, *Eminent domain, Docks, *Road construction, Land.
Identifiers: Coastal waters.

The Department of Natural Resources is directed, after notice in writing signed by the chairman of the public access board, and with the consent of the governor, to take by eminent domain or to acquire by purchase, lease or otherwise, the land and water areas designated by the board. These lands are to be used to provide public access and related facilities to coastal waters and great ponds. The department is also directed to construct and maintain roads, parking areas, docks, ramps and related facilities as the public access board may designate. The cost of the acquisition, construction, and maintenance is chargeable to the public access fund. (Watson-Fla)
W69-01295

SCHLOOP V NEW YORK)LIABILITY FOR FLOOD DAMAGE(.

190 NYS 2d 96-99 (Ct cl 1959).

Descriptors: *New York, Judicial decisions, *Flood damage, Lakes, Inland waterways, *New York State Barge Canal, Legislation, Dams, Water levels, Navigation, Gates, Outlets, Reefs, *Flood control.

Plaintiff claims damages alleged to have been caused by waters overflowing Oneida Lake. Oneida Lake and its outlet are part of the Barge Canal system. The question is whether there is liability for the damage. Damages caused by a public improvement, such as a canal, are not recoverable in the absence of trespass or negligence. At the close of the navigation seasons the Taintor gates were open wide in the lake outlet. There were no works or construction by the state restricting the flow of water. The restriction was caused by a natural formation, the Caughdenoy reef. The state had no obligation to remove this reef. Claimant's land would have been flooded if nothing had been done by the state. Since the state was using the lake and outlet for canal purposes only, the state was under no obligation to exercise flood control. Since there was no negligence or trespass by the state, claimant cannot recover. (Childs-Fla)
W69-01325

REED V NEW YORK)FLOOD DAMAGE(.
State of New York, Albany.

188 NYS 2d 760-761 (Ct cl 1959).

Descriptors: *New York, Judicial decisions, *Flood damage, Flood control, *Canals, *Culverts, Pipes, Water levels.

After a rainstorm, the water in an unused portion of a canal overflowed the banks causing damage to the property of claimants. The state had filled in the canal bed at one place to provide a roadway over the canal. Two pipes were placed under the roadway to provide for the flow of water. The state had notice of overflowing after the filling of the canal bed. The court found that the state failed to exercise ordinary care and maintenance by reason of the culverts either being clogged or inadequate. If the culverts were open and the state failed to open the gate valve to the lower level of water in the dam below, then they failed in their duty of reasonable care. Judgment was entered for claimants. (Childs-Fla)
W69-01326

VALIDITY OF PROHIBITION OF BATHING, SWIMMING, BOATING, FISHING, OR THE LIKE, TO PROTECT PUBLIC WATER SUPPLY,
C. C. Marvel.
56 ALR 2d 790-796.

Descriptors: *Legislation, Administrative agencies, *Regulations, Boats, Fishing, Swimming, Public health, Judicial decisions, *Water supply, Water quality, Water utilization, Condemnation, Ownership of beds, Riparian rights, Water rights, Water law.

The validity of statutes, ordinances, or administrative regulations which regulate or prohibit boating, fishing, or swimming in any kind of waters, public or private, in order to protect public water supplies is questioned. As applied to members of the general public, such regulations have been generally upheld as a valid exercise of the police power. Where such regulations adversely affect private rights, whether dependent upon the ownership of the bed, or upon riparian ownership, the courts have been divided in their decisions with respect to the validity of such prohibitions. If there is a substantial infringement on the individual's riparian rights the courts generally require the state to resort to a condemnation action and compensate thw owner for such loss. The validity of such regulations is also affected by any reservation of rights, or failure to reserve rights, by one granting water rights to a public agency. (R. Smith-Fla)
W69-01336

JOHNSON V IOWA STATE HIGHWAY COMM'N)SUIT TO RESTRAIN COMMISSION FROM BUILDING 5 PAVEMENT INTAKES WHICH WOULD DIVERT SURFACE WATER ONTO PLAINTIFF'S LAND(.
State of Iowa, Des Moines.

94 N W 2d 773-778 (Iowa 1959) 6 p.

Descriptors: Judicial decisions, *Iowa, Roads, Administrative agencies, Surface waters, *Surface runoff, Highways, Road construction, Diversion, Paving, *Intakes, Damages, Drainage systems, Legislation, Natural flow doctrine, Culverts, Ditches, Erosion, Spillways.

Landowners brought actions against the State Highway Commission which was widening and repairing a highway, to restrain allegedly illegal diversion of surface water onto the plaintiffs' land through five pavement intakes. The trial court entered decrees closing 3 intakes on one side of the road but refused to close the 2 intakes on the opposite side of the road. This court affirmed, stating that the construction of the drainage system will turn the natural drainage of some of the surface water, to the injury of the plaintiffs, and will thereby violate the defendants' statutory duty to drain the surface water from public raods in its natural channel. On this basis the court affirmed the closing of 3 of the intakes. The other 2 intakes would cost additional surface water on the plaintiffs' land but not enough to justify greater relief. It was also noted that it appears to be customary and in harmony with good engineering practices and definitely in the interests of the traveling public to place intakes and spillways where they will quickly take the accumulations of water off the pavement. (Watson-Fla)
W69-01340

BROWN V SCHOOL DIST)DAMAGE BY DIFFUSED SURFACE WATER(.
161 S E 2d 815-817 (S C 1968).

Descriptors: *South Carolina, *Surface runoff, *Surface drainage, Local government, Judicial decisions, Cities, Drainage, Damage, Water injury, Eminent domain, Surplus water, Precipitation excess, Storm drains, Water law, Surface waters, Legislation.
Identifiers: Catch basins, Streets, Just compensation, Cause of action.

This was an action by landowners asking actual damages for allegedly causing surface waters to be wrongfully concentrated and discharged onto plaintiffs' land. The school district built a school building across the street from plaintiffs' house. Plaintiffs' alleged that the construction of this building concentrated and discharged surface waters across the street and onto plaintiffs' property, and that the city did not provide proper drainage along the street as required by statute. The complaint admitted that the city had installed a catch basin in the street, but alleged that it was inadequate to handle all the water. The court held that the complaint stated a cause of action against the school district but not the city. Action by the city did not cause plaintiffs' injury. Action by the school board under statutory authority which effectively destroys or impairs the usefulness of private property amounts to a taking requiring just compensation. (Kirkconnell-Fla)
W69-01342

STATE V PENNSYLVANIA RR)LOCATION OF MEAN LOW WATER MARK(.

244 A 2d 80-85 (Del 1968).

Descriptors: *Delaware, *Low water mark, *Boundaries (Property), Water courses (Legal), *Water level fluctuations, Ownership of beds, Tidal effects, Legal aspects, Judicial decisions, Surveys, Land fill, Railroads.
Identifiers: Burden of proof.

The defendant railroad had filled in land bordering the Delaware River. The question presented was whether the defendant railroad had filled beyond the mean low water mark. The State of Delaware claimed that on the basis of surveys made in 1942 and 1954 the defendant had filled some areas beyond the mean low water mark and thus title to this land was in the state. The defendant claimed that the state had the burden to prove the accuracy of the earlier surveys by a preponderance of evidence. The court held that the 1967 survey was more accurate and the state had failed to establish the accuracy of the earlier surveys. The present coastline must be used where it is exceedingly difficult or impossible to determine the mean low water mark of the distant past. (Kirk-Fla)
W69-01345

ANDERSON V SUPER)OBSTRUCTION OF A DRAINAGE EASEMENT(.

28 111 2d 319, 192 N E 2d 339-341 (1963).

Descriptors: *Judicial decisions, Legal aspects, Water law, Remedies, *Natural flow doctrine, *Obstruction to flow, Surface runoff, Drainage, *Illinois.

Plaintiffs, alleged owners of a dominant heritage, enjoying a perpetual easement for drainage in a natural watercourse, brought suit to restrain the owners of the alleged servient estate and persons who they allowed to dump fill upon their land from further impairing the flow of surface water from plaintiff's land. The complaint alleged that the obstructions on defendants' land caused water to accumulate on plaintiff's land. A mandatory injunction was also prayed for to order defendants to remove the fill and a house and garage. At trial, the chancellor found for defendants. On appeal to the Supreme Court, affirmed. This case turned on the question of fact whether the drainage from plaintiff's land was obstructed by the fill and structures on defendant's land. Where there is conflicting evidence, and it is heard in open court, the chancellor's ruling based thereupon will not be disturbed unless clearly against the manifest weight of the evidence. (R. F. Williams-Fla)
W69-01355

MIDGETT V NORTH CAROLINA HIGHWAY COMM'N)CONTINUING NUISANCE AS A PUBLIC TAKING(.
260 N C 241, 132 S E 2d 599-609 (1963).

Descriptors: North Carolina, Eminent domain, Civil law, Natural flow doctrine, *Road construction, *Effects, Riparian rights, Riparian land, Appropriation, Water pollution, Flood damage, *Surface waters, Sea water, Atlantic Ocean.
Identifiers: *Nuisance (Legal aspects).

The construction of a highway by defendant highway commission constituted a dam which prevented ocean waters that for many years had come over dunes in time of storm from being dissipated toward sound and which caused great quantities of water to inundate the property of plaintiff. The judgement for the defendant was reversed because defendant's construction was an appropriation of land for public use. North Carolina does not apply the common enemy doctrine to surface waters, but applies the Civil or Natural Flow Doctrine. The effect of the highway was to create a private nuisance. It was a jury question as to whether or not defendant might reasonably have anticipated storm or flood. A continuing nuisance maintained by government which substantially impairs private property values is a taking in the constitutional sense. (Crabtree-Fla)
W69-01359

HEWITT V CHICAGO B ANDQ RY)OBSTRUCTION TO FLOW CAUSING FLOODING(.

426 S W 2d 27-33 (Mo 1968).

Descriptors: *Flood damage, Floods, Obstruction to flows, Streamflow, Riparian rights, Riparian land, Levees, Water law, Legal aspects.
Identifiers: Evidence.

The plaintiffs brought action for damages from flooding caused by defendants' railroad bridge which was alleged to have been constructed without suitable openings. The court held that the evidence was sufficient for the jury to find that the flood damage in 1964 was caused by the defendants' bridge. There was a lack of evidence, however, to establish that the bridge was the cause of flooding in 1960 through 1963. Where an obstruction of a watercourse causes annual or occasional flooding of lands, each repetition of overflow gives rise to a new cause of action. (Horner-Fla)
W69-01366

TURNER V ROSS)DAMAGES FOR INCREASING FLOW OF SURFACE WATERS(.

115 Ga App 507, 154 SE 2d 798-801 (1967).

Descriptors: *Georgia, Natural flow, Judicial decisions, Remedies, *Surface runoff, *Surface drainage, Riddance (Legal aspects), Drainage water.
Identifiers: *Damages (Legal aspects), Dominant estate, Servient state, Remedies (Legal aspects).

This was a suit for damages by the owner of a servient lot against the owner of an adjoining dominant lot for maintaining an abatable nuisance. Defendants graded the dominant lot in such a way that it increased the natural flow of surface water onto plaintiff's lot, causing silting of plaintiff's lot and flooding of his basement. The main issue was the proper amount of damages. There was conflicting testimony from the plaintiff as to the amount of damage to his property, and during the course of the trial plaintiff's counsel stated that in this suit the plaintiff could not recover future and permanent damages. The court held that the plaintiff's testimony must be strictly construed against him as to the amount of damages, and that the statement of plaintiff's counsel estopped plaintiff from recovering damages for permanent dimunition in value of his property. (Kirkconnell-Fla)
W69-01367

CENTRAL INDIANA RY V MIKESELL)DAMAGES FROM EMBANKMENT COLLAPSE(.

221 NE 2d 192-201 (111 App Ct 1966).

Descriptors: *Storm runoff, Drainage, Tile drainage, Rainfall intensity, Storms, *Damages, Washouts, Legal aspects, Collapse, Embankments, Probably maximum precipitation, *Excessive precipitation, Culverts.
Identifiers: Railroad embankment, Anticipated rainfall.

A 15 foot high railroad embankment running along the back of plaintiff's residential property gave way during a heavy downpour. The railroad maintained two tiles totaling 20 feet of opening for the passage of water through the grade. The street running along the front of plaintiff's lot had a drainage pipe with a 19.5 foot opening. Defendant's argument that layer openings under the grade would have caused damage, and that water upon plaintiff's land prior to the break caused the damage, were rejected because the damage was cause by the sudden spurt of water from the break in the embankment. Even though the size of the downpour was unusual and extraordinary, there was sufficient evidence for the jury to determine that the exercise of reasonable skill and foresight should have led to its being anticipated. There was evidence that such rains occurred with a frequency of from 20 to 100 years, and that defendant's opening were insufficient. Damages of $2,628 were allowed to compensate for the loss of plaintiff's garage, tool shed, flower garden, family snapshots, driveway and fence, and damage to the foundation and basement of the house. (McDermott-Fla)
W69-01375

LOWE V LOGE REALTY CO)NATURAL WATERCOURSE AND DIFFUSED SURFACE WATER DISTINGUISHED(.

214 N E 2d 400-403 (Ct App Ind 1966).

Descriptors: *Indiana, Natural streams, *Drainage water, Surface waters, Surface runoff, Repulsion (Legal aspects), Obstruction to flow, Intermittent streams, Legal aspects, Judicial decisions, Relative rights, Alteration of flow, Riddance (Legal aspects).

Plaintiff alleged that the defendant was building roads and storm sewers which collected large quantities of rain water and snow water and discharging them on plaintiff's land. Defendant counterclaimed and alleged that there was a natural watercourse across plaintiff's land, and that any flooding of plaintiff's land was the result of obstructions placed in the watercourse by the plaintiff. The Indiana appellate court held that where surface water begins to flow in a definite direction in a regular channel with well-defined banks and bottom, and the flow is from time immemorial and for a substantial period each year, a natural watercourse exists. A landowner can prevent surface water from running on his property by erection of barriers, but where, as here, there is a natural watercourse he cannot barricade it so as to cause damage to another. The plaintiff would be entitled to relief only where the defendant by artificial means so increased the volume of flow as to damage the plaintiff, since the defendant had the right to reasonably divert the flow of surface water into a natural watercourse. (P. N. Smith-Fla)
W69-01380

GARFIELD V EAST PATTERSON)INCREASING FLOW OF SURFACE WATERS(.
47 N J 195, 219 A 2d 865 (1966).

Descriptors: *New Jersey, *Overland flow, *Surface runoff, Judicial decisions, Floods, Local government, Cities, Flood damage, Watercourses (Legal), Natural streams, Surface drainage.

This was an action by a city against numerous defendants, including the State Highway Department and the New Jersey Highway Authority for periodic flooding of a natural watercourse. The city's contention was that with development of the area by defendants, water which would have found its way slowly to the watercourse was now sped on that course by paving and other improvements; and thus the propensity for flooding was intensified. Judgment was properly rendered for the several defendants where, upon the record made, a court could not possibly assess responsibility, if any, of any of the governmental defendants. (Kirkconnell-Fla)
W69-01386

SHERRILL V NORTH CAROLINA STATE HIGHWAY COMMISSION)OBSTRUCTION TO FLOW OF SURFACE WATER(.
264 N C 643, 142 S E 2d 653-657 (1965).

Descriptors: *North Carolina, Damages, *Culverts, Easements, Legal aspects, Eminent domain, Judicial decisions, Watercourses (Legal).
Identifiers: Constiutional law.

Plaintiffs brought an action against defendant Highway Commission for damage to their property. The commission was responsible for maintenance of a culvert which allowed waters of a creek to pass under a highway and by part of the plaintiffs' property. Due to an increased volume of drainage water, heavy rains, and the fact that the angle of the culvert did not follow the natural course of the stream, the foundation of the plaintiffs' store and other property was damaged. The Supreme Court of North Carolina, overruling a lower court, held that these facts were sufficient to establish that the continued maintenance of the fill, culvert and highway constituted a permanent taking in the constitutional sense as of the time that the bank of the creek had washed away up to the plaintiffs' property. Subsequent to this time an easement to discharge water against plaintiff's property was taken, which would also require compensation. (Patterson-Fla)
W69-01390

COMMONWEALTH V THOMAS)RIPARIAN RIGHT OF ACCESS(.

427 S W 2d 213-218 (Ct App Ky 1967).

Descriptors: *Kentucky, Legal aspects, Judicial decisions, Riparian rights, *Eminent domain, Compensation, Riparian land.
Identifiers: Right of access.

In this case landowners seek to recover for loss of access to a lake by reasons of construction of a

roadway and fill across an inlet of the lake bordering on the landowner's property. The court held that riparian landowners have the right of a reasonable access to the entire body of water on which their land borders. This right of access has value, and before the state can take or impair such right it must pay just compensation to the owner for it. (P. N. Smith-Fla)
W69-01395

EFFECT OF URBAN GROWTH ON STREAMFLOW REGIMEN OF PERMANENTE CREEK, SANTA CLARA COUNTY, CALIF,
E. E. Harris, and S. E. Rantz.
U S Geol Survey-Water Supply Paper 1591-B, 1964. 18 p.

Descriptors: *Storm runoff, *Land use.
Identifiers: *Urban drainage, Surface permeability.

Evidence that volume of storm runoff produced by rainfall on valley floor has increased substantially as result of urbanization; increase in outflow is attributed to fact that urban development during period 1945 to 1958 increased extent of impervious surface in product area from about 4% to 19%.

JOHNSTON V STAPLES)CREATION OF WATERSHED DISTRICT(.
408 S W 2d 206-207 (Ky ct app 1966).

Descriptors: *Kentucky, Water conservation, Remedies, Judicial decisions, Federal government, Legal aspects, Taxes, *Watershed management, Water districts.
Identifiers: Conservation districts.

In an action challenging the validity of a watershed conservancy district's creation and to prevent making of an exploratory survey to determine feasibility of creating such a district, summary judgment was granted for defendant. Appellants are seeking to test the correctness of the trial court's refusal to accept their amended complaint alleging that much of the land within the district belonged to the U S government and was not subject to taxation as required by the statute creating conservancy districts. This court found that while the statute does provide that all property within a district shall be taxed the statute should be read to carry out legislative intent. The intent was only to tax property subject to tax. In any event the U S government had not complained of the inclusion of its land within the district and appellants could not do so. The trial court did not abuse its discretion in refusing the amended complaint. (Kahle-Fla)

COSTLEY V LONG)DAMAGES FOR DIVERSION OF STREAM(.
112 Ga App 758, 146 S E 2d 153-155 (1965).

Descriptors: *Georgia, Legal aspects, Judicial decisions, *Alteration of flow, Streamflow, Diversion, Streams, Erosion, Stream erosion, Relative rights, Flood damage, Water injury.

This is an action between adjoining landowners in which the plaintiff sought to recover damages for diversion of a stream on defendant's land which caused water to stand on plaintiff's land and which caused erosion of his land. The Georgia Court of Appeals held that a landowner can change the course of a stream running through his property, provided that he return it to its original channel before it leaves his property and so long as the change does not injure or unduly interfere with any other landowner. When this change of course results in flooding and erosion of plaintiff's land, he may recover for the diminution of fair market value of his land caused by the defendant's actions. (P. N. Smith-Fla)

EVALUATION OF MULCHES FOR WATER-EROSION CONTROL,
N. P. Swanson, A. R. Dedrick, and H. E. Weakly
Trans Amer Soc Agric Eng, Vol 8, No 3, pp 438-440, 1965. 3 p, 5 tab.

Descriptors: Arid climates, Stubble mulching, *Mulching, Organic matter, Water conservation, *Erosion control, *Rainfall intensity, Hay, Rates of application, Asphalt, Runoff.
Identifiers: Plots, Straw.

Objectives of a water erosion study conducted at Lincoln, Nebraska, were: (a) to compare the relative effectiveness of prairie hay, wheat straw, woodchips, and an asphalt emusion in protecting a soil surface against water erosion and (b) to determine the most effective method of anchoring organic materials for stabilizing soil surfaces against water erosion. Three high rainfall intensities were used to check the effect of runoff and sediment load from the plots. A 1/2-ton-acre prairie hay mulch anchored by an asphalt emulsion applied at 1 quart per square yard provided the best protection against water erosion. Prairie hay and wheat straw were comparable in their effectiveness as mulches for protection against water erosion and were more effective than woodchips. Equal amounts of prairie hay mulch applied as a loose mulch or anchored with a disk packer were not significantly different in amount of protection provided against water erosion. Materials and methods used in the study could be applied to arid climates where high rainfall intensities cause water-erosion control problems. (Blecker-Ariz)

5A. Identification Of Pollutants

EVALUATION OF AN INDEX FOR VIRAL POLLUTION,
Kansas Water Resources Research Institute, Lawrence.
Raymond C. Loehr, and Diann T. Schwegler.
OWRR Research Report A-001-KAN, University of Kansas, Lawrence, pp 1-59, May 1965-June 1966. 59 p, 16 fig, 13 tab, 36 ref.

Descriptors: *Viruses, Water pollution, Waste water, Water treatment, *Water quality, pH, *Sampling, Bacteria, Epidemics, Bacteriophage, Detection, Potable water, Bibliographies, *Evaluation, Waste treatment, Waste water treatment.
Identifiers: Water biology.

Current viral detection techniques rarely are used routinely by health agencies or water treatment personnel to monitor potable and waste water because of the equipment and experience necessary. This report explores the use of coliphage, viruses of coliform bacteria, as a measure of the virological quality of water. Some results of this research are: (1) For routine sampling of water and waste water, the soft agar technique is more precise and less likely to be affected by contaminants than is the filtration method. (2) There is no need for sample preparation prior to detection of the phage except to inhibit phage reproduction between sampling and analysis. (3) The average coliphage concentration in waste water was about 1000 phage/ml. The range of collected data was from 25 to 22,000 phage/ml. (4) The analysis of coliform phage in water and waste water continues to show promise as a routine technique to monitor the virological quality of such waters. (Hess-Kansas)

BIOLOGICAL FIELD INVESTIGATIVE DATA FOR WATER POLLUTION SURVEYS,
Federal Water Pollution Control Administration, Washington, D. C.
William M. Ingram, Kenneth M. Mackenthun, and Alfred F. Bartsch.
Fed Water Pollut Contr Admin Publ WP-13, 1966. 139 p, 51 fig, 5 tab, 467 ref. FWPCA Grant WP 00013.

Descriptors: Biology, *Water pollution, Bioassay, Aquatic life, On-site investigations, *Pollutant identification, Aquatic environment, *Investigations, Bibliographies, *Reviews.

A compilation such as this was first envisioned by the senior author in 1950 during the early years of the national water pollution control program. Over the past 15 years there has been a great demand for biological information as related to water pollution prevention and abatement programs, indicating a need to publish under one cover the natural history aspects of water pollution investigations. Today there are many professions working in water pollution control. All of them can well utilize some basic knowledge of the ecological environment. This book will serve to introduce the non-biologist to the life sciences as they relate to water pollution and its control. The professional biologist, inexperienced in water pollution investigations, will find the book a quick introduction to field studies of polluted streams, lakes and artificial impoundments. For the professional investigator, sources of

further information, both general and detailed, are set forth in the selected references and bibliography to help in his field studies - an underlying feature of the national effort to conserve and protect our water resources. (Author)

ANALYSIS OF NATURAL RADIOELEMENTS IN RAW WATER,
Rhode Island University, Kingston.
Vincent C. Rose.
Final Rep, Water Resour Res Proj A-011-RI, Washington, D. C., June 1967. 5 p, 1 ref.

Descriptors: Water, Ion exchange, Gamma rays, Spectrometers, *Water pollution, Analysis, *Radioisotopes, X-ray analysis, Resins.

Experimental ion exchanger loaded filter papers have been prepared to remove natural radioelements from water. In preliminary studies a mixture of 40% Permutit Q, 30% cellulose and 30% fiber glass gave optimum flow rates for the total removal of potassium. The optimum resin size was 80-100 mesh. In later studies the fiber glass was eliminated to permit x-ray analysis of other trace metals. After studying composition, flow rates, number of passes through the filter and percent removal, a composition of 45% resin (50-100 mesh) was selected. A combination of two papers and multiple recycle was necessary to make the results independent of flow rates. Five milliliter plastic columns containing Permutit Q were prepared to fit in the 5/8 inch well of a NaI crystal. Loading curves were determined for K, Rb, Th and U. Low sample to background rates precluded the use of gamma spectrometry for the analyses of K. and Rb. As little as 0.5 mg of Th and U were detectable with a 40 minute counting time. (Author)

AMENDMENT TO THE SANITARY WATER BOARD ACT OF 1951.
State of Illinois, Springfield.

Illinois Laws ch H 1921 (1967).

Descriptors: *Administrative agencies, *Illinois, Legislation, Administration, Planning, State governments, Programs, *Water pollution control, Water quality, Waste water (Pollution), Standards, Legal aspects, Water law, Water policy, Financing, Government finance, Sewage treatment, Water pollution treatment, Project planning, Pollutant identification.

Section six of the Illinois 'Sanitary Water Board Act' of 1951 is amended by this act. The power of the Sanitary Water Board is extended so that the Board may determine if pollution exists in any of the state's waters, and make orders requiring the discontinuance of pollution activities. The Board is specifically authorized to make findings of fact with respect to violations of the Act, or of the Board's orders; to institute legal proceedings to compel compliance with th Act; to issue or deny permits for the discharge of sewage; and to promulgate standards of quality for the state's waters. Among the duties assigned to the Board are the following: To prepare a comprehensive plan for abatement of present and future pollution, to scrutinize all plans for sewage works and to inspect their construction, and to serve as the state's agency for the receipt of federal funds for pollution abatement. The Board is given the right to enter private property in order to inspect conditions relating to pollution, and to require submission to it of any relevant records or reports. (Pfeiffer-Fla)

A PROBABILISTIC METHOD OF APPRAISING BIOASSAY SAMPLING PROGRAMS,
E I duPont de Nemours And Co, Savannah River Lab, Aiken, S C.
F. Delano Knight, and S. Marshall Sanders, Jr.
Health Phys, Vol 14, No 5, pp 523-524, May 1968. 2 p, 1 fig, 2 ref.

Descriptors: *Path of pollutants, Bioassay, Radioisotopes, Water pollution effects, Water pollution sources, Radioecology, Public health, Radioactivity, Hazards, Probability sampling.
Identifiers: Health physics, Plutonium, Maximum permissible body burden.

A new criterion, developed to appraise coverage of health physics sampling programs of periodic urinalysis, can now be expressed in terms of the probability, P, of detecting an assimilation of D% of maximum permissible body burden in a group of individuals where the fraction of the group, F, is sampled every I days. That probability is defined by the relationship, $P = 1 - (1-F)$ to the mth power $(1-F(n-m))$, where n is the ratio of T/I and m is the number of whole integers in that ratio. Values of T, the length of time when the rate of excretion is above the limit of detection, can be computed from an exponential expression relating E, the quantity of radionuclide excreted per day T days after assimilation, to D and T. That calculation for plutonium takes the form, $T = (2.0424D/E)$ to the 1.3 power.

WATER POLLUTION - NATURE, EFFECTS, TREATMENT, ALTERNATIVES TO TREATMENT.

pp 5-17 of Entry No. W69-01269 in 05G.

Descriptors: Biochemical oxygen demand, Chemical wastes, Decomposing organic matter, Domestic wastes, Farm wastes, Industrial wastes, Organic wastes, Oxygen sag, Nitrification, *Pollutant identification, Pollutants, Radiological wastes, *Water pollution, *Water pollution effects, Water pollution sources, *Water pollution treatment, Pollution abatement, Water treatment, Sediments, Public rights.

A summary of the physical aspects of water pollution and the technical devices available for its abatement is presented. Various classification systems are discussed, but it is concluded that these tend to obscure the complex phenomena that occur in a stream. The primary effects of water pollution are discussed. These are recreational and aesthetic effects, effects on domestic supplies, effects on industrial supplies and the establishment of a technical link between economic units. Methods of treatment are discussed with emphasis on the broad range of alternatives available. It is concluded that value considerations must be introduced into the decision making process and that public intervention is justified. (Pfeiffer-Fla)

PHOSPHORUS CONTENTS OF SEWAGE-POLLUTED WATERS,
Indian Inst of Science, Bangalore, India.
E. G. Srinath, S. Sathyanarayana Rao, and S. C. Pillai.
Indian J Exp Biol, Vol 4, No 2, pp 114-119, 1966. 6 p, 9 tab, 42 ref.

Descriptors: *Eutrophication, *Water pollution sources, Nutrients, Phosphates, Activated sludge, Sewage, Protozoa, Aeration, Ponds, Rivers.
Identifiers: India, Epistylus.

Soluble phosphates in relatively high concentrations characterize sewage-polluted waters. Values for phosphorus concentrations in some polluted water from Indian rivers and ponds range from 1.7 to 3.1 mg/1, of which 71-90% is in soluble form. When sewage samples are diluted with tap water in different proportions and these samples are allowed to stand or are artificially aerated for 15 days, amounts of soluble phosphate in the supernatant liquids are not appreciably altered. Activated sludge with associated protozoa (principally Epistylus) removed about 85% phosphorus from supernates of undiluted sewage after 6-hr aeration, but only about 26% from diluted sewage samples. The reduced removal of phosphate in diluted samples is attributed to lack of other necessary nutrients. To eliminate 2.7 mg/1 of phosphate from effluent of activated sludge process, the following concentrations of chemical coagulants (in mg/1) were found to be required: alum only, 5; lime only, 5; ferric chloride only, 6; alum and lime, 2 each; alum and ferric chloride, 2 and 3 respectively; and lime and ferric chloride, 2 and 3 respectively. Waters unpolluted with sewage may also contain phosphate, depending on the nature and extent of their contamination with other forms of organic matter.

MAJOR SOURCES OF NUTRIENTS FOR ALGAL GROWTH IN WESTERN LAKE ERIE,
Federal Water Pollution Control Admin., Grosse Ile, Mich.
George L. Harlow.
Publication Number 15, Great Lakes Res Div, Univ Mich, pp 389-394, 1966. 6 p, 2 fig, 5 tab, 9 ref.

Descriptors: *Eutrophication, *Lake Erie, *Nutrients, Algae, Water pollution sources, Nitrogen compounds, Phosphates, Great Lakes, Michigan.
Identifiers: Lake St Clair, Rouge River, Huron River, Raisin River, Detroit River, Maumee River.

Due to an excess of nutrients, western Lake Erie has developed prolific blooms of algae contributing to and indicating the accelerated enrichment of this valuable natural resource. Nutrient concentrations and quantities increase as the waters from Lake St Clair pass by the metropolitan complex of Detroit to western Lake Erie. The sources of waste which contribute to these increases are presented, as well as the relative quantities from each waste source. Municipal wastes contribute 89% of total phosphates and 86% of total nitrogen received into Lake Erie from southeast Michigan, whereas the contribution of phosphate from land drainage is a minor factor. Nitrogen runoff from lands contributes more significantly to nutrient loading than does phosphate from the same source. In Lake Erie, concentrations of nutrient compounds closer to the mouth of the Detroit River are higher than at stations further offshore, except in the case of two

offshore stations thought to be influenced by the Maumee River. Results of nutrient determinations from all stations reported for Lake Erie show concentrations greater than those thought to be critical for triggering blooms of algae.
W69-01445

SOURCES OF NITROGEN AND PHOSPHORUS IN WATER SUPPLIES. TASK GROUP REPORT.

J Am Wat Wks Ass, Vol 59, pp 344-366, 1967.

Descriptors: Runoff, *Nutrients, Nitrogen, Phosphorus, *Water supply.
Identifiers: *Urban drainage.

In this second part of Task Group 2610P of the American Water Works Association, the sources from which nitrogen and phosphorus may enter water supplies are reviewed; a bibliography of 63 references is appended. Sources of these nutrients include sewage, synthetic detergents, industrial wastes, compounds used in water treatment, run-off from agricultural and urban areas, wastes from farm animals and wildfowl, rainfall and dustfall, and nitrogen fixation. Some figures showing increases in nutrient content of various rivers and lakes in U.S. are quoted. From the available data, an attempt has been made to estimate the relative significance of the various sources of nitrogen and phosphorus, and the results are tabulated, showing that agricultural run-off is the greatest single contributor of nitrogen and phosphorus to water supplies. The possibility of controlling the amounts of nutrients contributed by various sources is considered briefly.
W69-01497

POLLUTION OF THE RIVER MERSEY.

Effluent and Water Treatment J, Vol 3, pp 217-22, April 1963.

Descriptors: *Storm runoff, *Overflow, Cities, *Water pollution, Bioindicators.
Identifiers: *Combined sewers, *River Mersey, Great Britain.

The chief source of pollution in the River Mersey is from large discharges of trade effluents. The discharge of such wastes into public sewage treatment works would improve the condition of the river substantially. The desirability of treating trade wastes in sewage treatment plants indicates the advantage of centralization of sewage disposal works. Another major source of pollution in urban areas is the premature operation of storm sewage overflows. This frequently happens in dry weather when streams are at low flow. The Mersey River Board has recommended that, where practicable, the overflows would not operate until at least 8 times dry weather flow has been reached. The significance of pollution is evidenced by typhoid, paratyphoid, and Salmonella infections directly from polluted water or indirectly from food contaminated by it.
W69-01501

SECOND QUINQUENNIAL ABSTRACT OF STATISTICS RELATING TO RIVER SURVEYS IN THE TRENT WATERSHED COVERING THE FIVE-YEAR PERIOD 1957 TO 1961)WITH SOME SUPPL DATA FOR 1962(.
Trent River Board.

120 p, map.

Descriptors: *Storm runoff, *Water pollution, Sewers, Overflow.
Identifiers: *Urban drainage.

Data are tabulated from chemical and biological surveys of rivers in the Trent watershed in the period 1957-1962, and the percentage change in composition between 1951 and 1962 is estimated for various sampling points. The condition of the various stretches of watercourses is indicated on a map using a colour-coding scheme. At present, about 80 per cent of the streams in the watershed are reasonably clean and of some use to the community, but there are still about 150 miles of watercourse which are badly polluted. Only 60 per cent of the sewage effluents reach the requirements set by the River Board but the treatment facilities are being improved gradually. Factors contributing to the deterioration of surface waters are discussed, including the delay in constructing water-treatment facilities for new housing and industrial developments, increasing volumes of effluent and increasing abstractions of water (which increase the ratio of used matural water in the streams), and increasing volumes of storm run-off for which there is insufficient sewer capacity, especially in older urban sewerage systems which do not provide capacity for six or even three times dry-weather flow. Where it is not practicable to improve conditions in streams by imposing higher standards for effluents and discharges from storm-sewage overflows, it may be necessary to consider 'farming the river' to ensure the greatest possible degree of self-purification.
W69-01511

ANNUAL REPORTS OF THE SEVERN RIVER BOARD AND THE WYE RIVER BOARD FOR THE YEAR ENDED 31ST MARCH, 1964.
Severn River Board; Wye River Board.

77 and 60 pp respectively.

Descriptors: *Water pollution, *Storm runoff, *Standards, Biochemical oxygen demand, Discharge (Water), Estuaries.
Identifiers: *Suspended solids, Great Britain.

Both these reports contain sections on water resources, fisheries and prevention of pollution. Hydrological surveys are reported for parts of the catchments of the rivers Bewdley and Avon. Abstraction of water irrigation is increasing and the importance of providing bank storage has been emphasized. Results of surveys of the rivers Severn and Avon, certain of their tributaries, and tidal waters are given and discussed in detail in relation to the various sources of pollution and prospects for future improvements. It is planned to make a complete survey of the rivers Wye and Lugg each month, with less frequent sampling of other tributaries, and the first two complete surveys are reported and discussed. It is considered that effluents discharged to the Wye estuary should conform to the normal standards for a grade-one effluent, in view of the character of the river and the mortality of salmon in the tidal reaches nearly every summer. A measure of control has also been extended to estuaries in the Severn River Board area, and an appreciable departure from the normal working standards was possible when determining the required standards for partially-treated sewage and sewage-works effluents. Basic standards for the discharge of effluents to watercourses are also outlined, including those for pre-1951 discharges. In the case of farm waste waters, allowance is made for the self-purification which may take place in the ditch or stream to which the effluent is discharged. With regard to partially-treated storm sewage, the Severn River Board have abandoned the standard limiting the BOD and, apart from specific standards for toxic materials, the strength and quality of these discharges are now controlled by a limit of 100 p.p.m. on the concentration of suspended solids. This standard also applies in the Wye River Board area where the concentration of sulphide is also limited to 1 p.p.m., as hydrogen sulphide. The standard imposed on the discharge of chlorinated water from a swimming pool limited the concentration of chlorine to 0.5 p.p.m., as free chlorine, and also limited the rate of discharge to ensure that there was sufficient dilution available in the receiving stream to avoid the risk of toxicity to fish. Alterations in the treatment and discharge of sewage and trade waste waters are outlined, together with proposals for new treatment plants.

5C. Effects of Pollution

EFFECTS OF WASTES ON RECEIVING WATER--SOME COMPUTATIONAL AND SCIENTIFIC PROBLEMS.

pp 49-56 of Entry No. W69-01269 in 05G.

Descriptors: Biochemical oxygen demand, Alga toxins, Organic wastes, Pollutant identification Pollutants, Quality control, Water pollution *Water pollution sources, Separation techniques *Analytical techniques, Classification, *Model stu dies, Waste identification, Biological properties Physical properties, Waste water (Pollution) Water quality, Water pollution effects, Impaire water quality, Wastes.

Computational and scientific problems involved i determining the effect of wastes on receiving wate are discussed. The need for an efficient and flexibl means of calculation of pollutants is noted an problems involved in devising such a means ar discussed. Two basic problems are presented. Th first is the conceptual problem of devising a mode which comprehends relevant relationships and i amendable to rapid calculation. The second is th determination of the specific numerical effect of change in one variable on the others. It is con cluded that accurate knowledge of physical an biological relationships in water bodies is an esse tial prerequisite to the design and operation of op timum waste-disposal systems. Research geared t exploring a more definitely empirical approach t water phenomena is encouraged.

MEASURE OF DAMAGES FOR POLLUTI OF WELL, CISTERN, OR SPRING,
F. G. Madara.
19 ALR 2d 769-783.

Descriptors: *Water pollution, Damages, Le aspects, Cisterns, *Wells, *Springs, Measuremen Identifiers: Permanent damage, Tempora damage.

The general measure of damages for permanent injury by pollution of a well, spring, or cistern is the difference between the market value of the land before injury and after it. An alternative measure sometimes used is the cost of supplying the injured plaintiff with water of equally pure quality of that which he had. Injury which would last for an indefinite period of time could be treated as a permanent injury. For a temporary injury, one that is abatable, the plaintiff is usually allowed that amount which would compensate him for diminution or loss in the value of the use of the well, spring, or cistern during the time the pollution continued, limited in some jurisdictions to the time of the commencement of action and in others to the time of the trial. An alternate method allows the plaintiff to recover the depreciation in rental value of the property while the pollution lasts. If the plaintiff could have removed the cause of the pollution, his damages would only run up to the time when he could have ended the pollution. Special and consequential damages may be recovered as long as they arise directly and proximately from the pollution. Punitive damages have been allowed. The landowner could also recover expenses occasioned as a result of the pollution, such as purifying a well or getting a new one. (Sisserson-Fla)
W69-01297

MEASURE AND ELEMENTS OF DAMAGES FOR POLLUTION OF A STREAM,
W. R. Habeeb.
49 ALR 2d 253-314.

Descriptors: *Judicial decisions, *Damages, *Water pollution, Reasonable use, Value, Market value, Depreciation, Economic rent, Water utilization, Odor, Trees, Crops, Recreation, Boating, Swimming, Fish, Livestock.

Elements to be considered when measuring damages for stream pollution are examined. Where permanent or irreparable damage results, recovery may be had for the depreciation of market value of the property. However, where the damage can be remedied at a cost lower than the loss in market value, the cost of such repair becomes the measure of damages. Where the pollution is temporary or abateable, the measure is the depreciation in the rental or usable value of the property. Special damages may also be recovered, as may punitive damages, depending upon the particular circumstances. Particular items of damages such as impairment of use and enjoyment of property, noxious odors, discomfort and inconvenience, sickness, trees, crops, deprivation of use of water, recreation privileges, fish, death and injury of livestock, injury to business, expense of repairing injury, fencing, procuring water, expense of mill operations, and others are also examined. (S. Scott-Fla)

THE RELATION OF WATER QUALITY TO WATER USERS,
Resources for the Future, Inc.
Allen V. Kneese, and Blair T. Bower.
In Managing Water Quality, Baltimore: Johns Hopkins Press, 1968, Chap 3, p 31-41, 1 fig, 10 ref.

Descriptors: *Water quality, Domestic water, Water quality control, Non-structural alternatives, Water use, Irrigation water, Industrial water, Aesthetics, Recreation, Aquatic environment, Water treatment, *Water pollution effects.

Determining the effects of various levels and time patterns of water quality on different uses is a critical component of water quality management. With increasing population and rising production of goods and services, there is a concomitant increase in the production and discharge of water that have impacts on the quality of receiving waters. Even under natural conditions water may require modification for certain uses. Water quality necessary for aesthetic and recreational uses is defined. The effects of discharges of various substances on aquatic life have been the subject of many investigations with a wide variation in results. The factors that contribute to this are discussed. The amount and character of water treatment before domestic water use are related to the quality of water intake. Various aspects of this problem are briefly reviewed. Delineating the effects of the quality of water used for irrigation is more complex. Although water quality deterioration is reflected in crop yields, the extent to which crop yields are reduced is a function of a host of interrelated factors. The range of water qualities utilized in industrial operations is wide, depending in part on whether the water is to be used for processing, cooling, or sanitary purposes. These uses are discussed and some possible economical procedures put forth. (Gargola-Chicago)

PRODUCTION RATE, POPULATION DENSITY, AND DRIFT OF A STREAM INVERTEBRATE,
Minnesota Univ., St. Paul.
Thomas F. Waters.
Ecol, Vol 47, No 4, pp 595-604, Summer 1966. 10 p, 6 fig, 3 tab, 32 ref.

Descriptors: *Aquatic productivity, *Indicator organisms, *Productivity, *Mayflies, *Drifting (Aquatic), Streams, Invertebrates, Minnesota, Carrying capacity.
Identifiers: Baetis, Gammarus.

Production rates of stream mayfly, Bactis vagans, estimated by two different methods (growth method and drift method), were compared and related to population density and drift rate. Greater confidence is placed in estimate of productivity from growth. In the year of study, this mayfly had two summer generations and one winter generation (mean annual population density, 1.3 g/sq m). The two production rate methods yielded estimates of 9.1 and 12.6 g/sq m/year as the sum of the three generations; both estimates were minimal. Production rates for summer generations were higher than for winter generation, although winter production was still at a significant level. A linear relationship between drift and production was not demonstrable. Summer generations drifted in large quantities, up to about 22 g/day, but winter generation appeared to drift little, if any, until near the end of the generation in early spring. Ratio of annual production rate to mean population density, or turnover ratio, was 9.7, or 3.2 times the number of generations. Biomass of Gammarus in stream studied was 10-100 times greater than that of Baetis. Author includes compilation of turnover rates reported in the literature and discusses factors which influence them.
W69-01430

HEAT DISSIPATION AND INDUCED CIRCULATIONS FROM CONDENSER COOLING WATER DISCHARGES INTO LAKE MONONA,
Wisconsin Univ., Madison. Dept of Civil Engineering.
John A. Hoopes, Robert W. Zeller, and Gerard A. Rohlich.
February 1968, 213 p, Grant 133-5371, Engineering Experiment Station - 35.

Descriptors: *Thermal power plants, *Thermal pollution, Heat budget, Water pollution sources, Water pollution, Lakes, Wisconsin, Currents (Water), Winds, Meteorology, Mixing, Mathematical models, Thermal radiation, Jets, Circulation.
Identifiers: Lake Monona.

On Lake Monona, Wisconsin, two conduits supply cooling water to a steam-generating power plant (190 megawatts) and return heated water to the lake at a maximal rate approximating 243 cfs. At shoreline, outfalls discharge horizontally at temperatures 10 deg C greater than those of the lake. A floating baffle limits the extent of open water during winter months. Mechanisms of heat dissipation and velocity patterns resulting from heated discharges were studied by undertaking field surveys of temperature and velocity distributions in the lake seasonally and by developing mathematical models for prediction of observed temperature and circulation patterns. During non-winter months, warm water spreads as a two-dimensional jet in a surface layer about 3 ft thick. Steady-state, integral mass, momentum, and energy conservation relationships were used to describe mixing and resulting heat dissipation within the lake. Entrainment coefficients and rates of spread of jets depended on current-velocity and assumed values 2-10 times higher than those for quiescent fluid. In winter, mixing inside baffle and thermal transfer across open water surface cooled discharged water to approximately 4 deg C. Surface heat loss, calculated from radiation and temperature measurements, constituted 5-10% of total power plant heat rejection rate.
W69-01448

CLEAN UP OF LAKE MICHIGAN.

Effluent Water Treat J, Vol 8, No 5, p 255, May 1968.

Descriptors: *Water pollution control.
Identifiers: *Combined sewers, *Lake Michigan, Storm sewers, *Sewer separation, *Urban drainage.

Pollution control authorities in the four states bordering Lake Michigan and the Federal Government have signed an agreement with broad powers to correct pollution in that lake. According to this agreement, storm and sanitary sewers are to be separated in new developments and in connection with urban reconstruction projects, unless pollution can be controlled by other techniques. Pollution from existing combination storm and sanitary sewers is to be controlled by July 1977 by separation of sewage before it reaches the waterways.

WATER CONSERVATION IN FOOD PROCESSING PLANTS,
Maine University, Orono.
Matthew E. Highlands, John M. Hogan, and Sadik Al-Hakim.
Rep, Proj No R 1084-9, Univ Maine, July 1966. 9 p, 3 fig, 4 tab, 7 ref, append. OWRR Project A-008-Me.

Descriptors: Water conservation, Water reuse, Potatoes, Water quality, Water requirements, Industrial wastes, Planning, Economics, Economic efficiency, Industrial plants.

A study of water conservation and reuse in potato processing plants indicated approximately 18.8% of total water intake per day could be reused with little or no further treatment. An additional 14.6% of total daily water used could be reused if suspended solids were removed and treatment to reduce microbiological populations was applied. The foregoing applies to a specific plant. Because of wide variations in plant methods, individual plants should be surveyed before recommending water reuse.

DEFICIENCIES IN TECHNICAL AND ECONOMIC KNOWLEDGE--DAMAGES, TREATMENT, AND ABATEMENT COSTS.
pp 57-85 of Entry No. W69-01269 in 05G.

LIBRARY U. OF I. URBANA - CHAMPAIGN

Descriptors: Municipal water, Public health, Water pollution, *Water pollution effects, Water quality control, Sewage treatment, Tertiary treatment, Waste water treatment, Water pollution control, Oxidation lagoons, *Water pollution treatment, Commercial fishing, Economics, Cost analysis, Costs, Economic impact, Recreation, Public benefits, Welfare (Economics), Social aspects.

Some of the more significant aspects of the costs of water pollution and the assignment of water quality constraints where costs cannot be satisfactorily specified are discussed. It is concluded that even though ideal accuracy and certainty of water pollution costs may be unattainable, there has been comparatively little rigorous analysis of costs from the point of view of designing efficient water pollution control systems. Alternative water quality control measures discussed include orthodox sewage treatment plants, stabilization ponds, harvested ponds, and tertiary treatment, alterations of streamflow characteristics and direct recirculation. Determinable costs discussed include the treatment costs for municipal water supplies, damages to commercial fishing, and agricultural costs. Less determinable costs include aesthetical and recreational damages and damages to public health.

AN ACT TO PROTECT THE PUBLIC HEALTH AND TO CONSERVE AND PROTECT THE WATER RESOURCES OF THE STATE.
State of Indiana, Indianapolis.

Indiana Laws Ch 263 (1967).

Descriptors: *Legislation, *Indiana, Sewage treatment, *Administrative agencies, Regulation, *Waste water treatment, Management, Classification, Evaluation, Public health, Sanitary engineering.

Enforcement of this act is placed in the State Board of Health. It provides for classification of all waste water treatment plants. The act requires the examination and certification of all operators of waste water treatment plants as to their competency to supervise the operation of the type of plant operated. The act prescribes the powers and duties of the State Health Commissioner and provides for the promulgation of rules and regulations by the commissioner, with the consent of the State Board of Health, to effect the objectives of the act. Any person, firm, or corporation, both municipal and private, violating any provisions of the act or the rules and regulations adopted is guilty of a misdemeanor and is subject to a maximum fine of $500 for each day of operation in violation of the act or the rules and regulations adopted thereunder. (Watson-Fla)
W69-01305

AN ACT TO AMEND SECS 6111.01, 6111.03, AND 6111.31 OF THE REVISED CODE TO EXTEND TAX EXEMPTIONS FOR INDUSTRIAL WATER POLLUTION CONTROL FACILITIES.
State of Ohio, Columbus.

Ohio Laws ch S 20 (1967).

Descriptors: *Ohio, *Legislation, Pollution, Sewerage, *Treatment facilities, Waste disposal, Grants, *Taxes, Pumping plants, Pipes, Incineration, Permits, Watercourses, Industrial wastes.

Terms defined are: pollution; sewage; industrial waste; other wastes; sewage system; treatment works; disposal system; waters of the state; and industrial water pollution control facility. The powers of the Water Pollution Control Board include: developing water pollution control programs; administering grants; working with other agencies to accomplish pollution control; promoting studies relating to pollution; disseminating information; controlling procedures of the Board; issuring orders after public hearings prohibiting discharge of sewage or other wastes into waters of the state or requiring construction or modification of disposal systems; issuing or revoking permits for wastes discharge or for the operation of disposal systems; instituting proceedings compelling compliance with its orders; controlling industrial water pollution control certificates; certifying to the United States that an industrial water pollution control facility conforms with requirements when required by the Internal Revenue Code; and exercising all incidental powers. The Act provides procedures by which an industrial water pollution control facility may be excepted from personal property taxes, franchise taxes and sales and use taxes. Sections 6111.01, 6111.03, and 6111.31 are amended by this Act. (Childs-Fla)

DEPARTMENT OF HEALTH V PASSAIC VALLEY SEWERAGE COMM'N)DAMAGE BY DIFFUSED SURFACE WATERS(.
242 A 2d 675-684 (Super Ct N J 1968).

Descriptors: *Sewage districts, *Water pollution control, *Sewage effluents, *State jurisdiction, Administrative decisions, Water quality control, New Jersey, Judicial decisions, Treatment facilities, Water pollution treatment, Sewage treatment, Sewage disposal, Chlorination, Public health.

This action was on an order to show cause why defendant should not be directed to comply with orders of the Department of Health to improve its effluent treatment facilities to reduce harm to New Jersey waters. The court held that the Department of Health had jurisdiction over the pollution in Upper New York Bay and was empowered by statute to prescribed corrective improvements in defendant's treatment and demand compliance therewith. Absolute discretion, vested statutorily in defendant to determine the size and capacity of each sewerage works did not extend to the intensity of effluent treatment. Though the statute requiring submission to the Department's regulations was intended to enable the Department to supervise preconstruction waste treatment, except in those areas within the jurisdiction of defendant, it did not prevent the Department from requiring corrective measures by defendant to prevent pollution. The state's entering into a 1910 stipulation with federal authorities regarding pollution controls required of defendant did not preclude subsequent requiring of more stringent controls. Neither costliness nor difficulty of financing relieved defendant of it's obligation to cease polluting the waters. (Storace-Fla)

Identifiers: *Injunction, Treated sewage, Remedies (Legal aspects), Sewage treatment plants.

This was a suit to enjoin construction of an upstream dam on an intermittent watercourse flowing past plaintiff's property and to enjoin defendant from discharging sewage effluent into such watercourse. Defendant placed a dam across one of two branches of the stream to impound a lake. Plaintiff's only complaint about the dam was that it would diminish the flow of water past his property. The court found the plaintiff's damage from the dam to be minimal and denied the injunction as to the dam. Below the dam defendant proposed to construct a sewage treatment plant and discharge treated effluent into the stream. Testimony by engineers disclosed two alternative methods for disposal of effluent from the plant: (1) By direct discharge into the stream; (2) By means of an outfall sewer line to carry off the effluent. At times, due to operational failure of the plant, low quality effluent would flow into the stream. The cour balanced the interests of plaintiff and defendan and granted the injunction against discharge of e fluent into the stream. The injunction was prope even though the damage claimed by plaintiff wa wholly prospective. (Kirkconnell-Fla)

STORM OVERFLOW PERFORMANCE STU DIES USING CRUDE SEWAGE,
P. Ackers, A. J. Brewer, and A. E. Birbeck.
Symp on Storm Sewage Overflows, May 4, 1967.

Descriptors: *Overflow, *Storm runoff, Sewa treatment, *Weirs, *Stilling basins, Flow contr *Design, Discharge (Water).

Experiments were carried out to: (a) determine t difference in composition of storm sewa discharge from an overflow and that passed treatment; (b) compare the performance of the d ferent types of overflow; (c) examine the effecti ness of scum boards; and (d) measure the chang in flow to treatment with increasing total flow each structure. The types of overflow tested we (a) a low double side-weir; (b) a stilling pond; (c vortex; and (d) a high-level side-weir with a po tive flow control. The structures tested we designed to operate under hydraulic conditions nearly identical as possible. The overflows we designed to spill at a discharge to treatment of 1/ the maximum discharge and, with the exception the low side-weir, would limit the flow to treatme to 20% above the first spill discharge. The m practical form seemed to be the round-crest type. Measurements were made of: (a) discharge to treatment at first spill; (b) discharge to treatment and spill at various larger coming flows; and (c) the water levels in the ov flow chamber for these discharges. The high s weir had the best general performance, second w the stilling pond with the scum board 6 in. from crest, and the vortex overflow was the worst.

THE QUALITY OF STORM WEATHER FLOW
Gunnar Akerlindh.
Satryck ur Nordisk Hygienisk Tidskreff, Vol 31, 1, 1950.

Descriptors: *Storm runoff, *Overfl *Coliforms, Sewage, *Water quality, *Biochemi oxygen demand, *Rain water.
Identifiers: *Combined sewers.

The quality of storm-water flow, particularly surplus discharge from combined sewers, discussed in order to compute the required re lated flow; that is, the amount of flow to be diver for disposal. The three elements constituting sto weather flow--namely sewage, ground water, rain water, have been considered. Coliform b teria in samples taken from streets (high ru coefficients) and parks (low runoff coefficie were compared. The concentration of orga matter in rain water is comparatively great (B.O 100 to 200 ppm) being nearly as polluted sewage. In regard to coliform organisms, howe the rain water portion of the storm-weather f has a density of 100 to 1,000 per ml and, cordingly, is much lower than sewage and ha diluting effect on the sewage. The composition rain water flow varies greatly and indefinit Despite this, it is reasonable to assume a cons composition.

WHAT TO DO ABOUT POLLUTION FROM STORM SEWAGE OVERFLOWS.

Wastes Eng, Vol 33, 1962.

Descriptors: *Storm runoff, *Overflow, Outlets, *Chlorination, *Ozone, Design, *Water pollution, Sewage treatment.
Identifiers: *Storm sewers, *Urban drainage, *New York (N. Y.).

In a symposium on the treatment of storm sewage overflows presented by the Sanitary Engineering Division, Metropolitan Section, American Society of Civil Engineers, the subjects discussed were frequency and composition of storm-sewage overflows; the effect of storm-water outfalls on waters around New York City; techniques of analysing and classifying harbour water; sewage and storm-water chlorination; treatment of storm-sewage overflows with ozone; design of facilities for chlorinating storm water; and design and operation of sewerage systems to minimize pollution.
W69-01504

REPORTS ON THE PROGRESS OF APPLIED CHEMISTRY.

London, Society of Chemical Industry, 1963, Vol 48, 800 p.

Descriptors: *Water pollution control, *Legislation, *Storm runoff, Bioindicators.
Identifiers: *Bacteriological sampling.

Progress in the various branches of applied chemistry is reviewed, with a comprehensive list of references appended to each chapter. The following are among the subjects considered. (1) Sewage, trade wastes and river pollution. MC NICHOLAS, J. (pp. 322-333). This review covers legislation to control pollution of surface waters and beaches, and studies on river pollution; effect of polluting materials on fish; storm sewage; percolating filters; activated-sludge process; sludge treatment; effects of synthetic detergents; treatment of trade-waste waters; and instruments for the control and monitoring of sewage-treatment processes. (2) Biodegradability of detergents. DICKER, D. W. G. (pp. 334-342). Current progress in the development of 'biologically-soft' anionic detergent materials and the control of 'hard' materials is outlined, followed by a review of work on the measurement of biological degradability and its relation to molecular structure; studies on non-ionic detergents, since their relative contribution to pollution will increase as biologically-soft anionic detergents come into general use; and studies on the toxicity of surface-active agents and the removal of alkylbenzenesulphonates from waste waters. (3) Microbiology of water, sewage and industrial effluents. ALLEN, L. A. (pp. 532-541). This chapter covers the microbiology of water, especially sewage-polluted water, and of waste-treatment processes, particularly the various modifications of the activated-sludge process and the treatment of carbonization, cyanide, cellulose-manufacture and other trade waste waters. (4) Sampling for bacteriological examination. GIBBS, B. M. (pp. 541-549). Included in this review are sampling devices and techniques for the microbiological examination of water and mud. Other chapters of the report contain information on the disinfection of water by chlorination (p. 566) or ozonation (p. 602), demineralization of sea water using soluble phthalocyanine dyes to increase the rate of solar evaporation (p. 54), and the use of plastic pipes for drinking water (p. 622).

CHICAGO ACTS TO ATTACK COMBINED SEWER PROBLEM.

Civ Eng, Vol 38, No 8, p 99, Aug 1968.

Descriptors: *Storm runoff, Standards, *Manholes, *Storm drainage.
Identifiers: *Chicago (Ill.), *Combined sewers, *Residential sewers, *Urban drainage, Capacity.

The Chicago Metropolitan Sanitary District is planning separate facilities for storm runoff. In the meantime, it has issued an ordinance setting an interim policy for the issuance of permits within a 300-mile area now being served by combined sewers. Provisions of this new ordinance include: only one building drain is required to carry both building wastes and storm water runoff to the combined sewer but municipalities may require separate drains; industries must provide separate services to the control manhole for storm water and industrial wastes; on-site storm facilities for the attenuation of peak flows will be given consideration, but the final determination will be made by the local municipality; and in new construction, downspouting and surface drains to sewers are prohibited unless storm-water capacity has been provided or unless such drainage flows through detention and/or regulating devices.

200 POLLUTERS GET THE WORD EARLY.

Eng News - Record, p 12, Feb 1, 1968.

Descriptors: *Water pollution control.
Identifiers: *Combined sewers, *Urban drainage, *Sewer separation, Lake Michigan.

Included in a recent list of FWPCA recommendations on pollution in Lake Michigan is a statement that combined sewers be prohibited in all new urban areas and separated in all urban reconstruction projects. The recommendations call for the elimination of pollution from combined sewers in 55 cities by 1977.
W69-01513

A REVIEW OF THE LITERATURE OF 1966 ON WASTE WATER AND WATER POLLUTION CONTROL.

J Water Poll Control Fed, Vol 39, pp 689-749, 867-945, and 1049-1154.

Descriptors: *Water pollution control, *Chemical analysis, *Sewage treatment, *Storm runoff, Estuaries, Standards, Legislation.

In a review of literature published during 1966 on waste treatment and pollution control, subjects dealt with include methods of analysis (including automated chemical techniques); physical and chemical methods of sewage treatment; biological filtration; the activated-sludge process; disinfection of sewage; effects of synthetic detergents on sewage treatment and aquatic organisms; biodegradation of detergents; digestion, treatment, and utilization of sludge; recovery and re-use of sewage and trade waste waters as water supplies; design of sewerage systems and treatment of storm sewage; composting of garbage; treatment of specific types of trade waste waters; treatment, disposal, and polluting effects of radioactive waste waters; biological surveys of polluted waters; polluting effects of sewage and trade waste waters; toxic effects of metals, pesticides, and weedkillers; effects of thermal pollution; effects of pollution on the physiology of fish; bio-assay techniques; estuarine and marine pollution; microbiology of polluted waters; oxygen sag and self-purification; quality standards for streams; effects of pollution on water supplies; pollution of ground water; eutrophication of natural waters; use of systems analysis in managing water resources; and legislation controlling pollution.
W69-01514

NINTH ANNUAL REPORT, FOR THE YEAR ENDED DECEMBER 31ST 1963.
Water Research Association.

44p.

URBAN U. W. I. URBANA - CHAMPAIGN

Descriptors: *Coliforms, Chemical analysis, Turbidity, *Computer programs, *Rainfall-runoff relationships, Groundwater recharge, *Instrumentation, Rain gages, *Sewer hydraulics, Pipes.
Identifiers: *Leak detection.

This report on the work of the Water Research Association contains individual sections on biology (development of synthetic media for use in the coliform test and methods for controlling algae); chemistry (coagulation of water, dewatering of water-works sludge, and methods for the determination of free and combined chlorine, turbidity, chemical oxygen demand (to avoid interference by chlorine) and traces of organic chemicals, pesticides, and herbicides); hydrology (particularly the use of an analogue computer to solve problems connected with the relations between rainfall, runoff, and evaporation, estimation of evaporation from catchment areas, and abstraction and artificial recharge of ground water, and development of instruments for measuring rainfall and stream flow); physics (detection of leaks and properties of pipes); and plant processes (coagulation, demineralization, and fluoridation).

FIFTEENTH AND FINAL ANNUAL REPORTS OF THE BRISTOL AVON RIVER BOARD AND THE SEVERN RIVER BOARD FOR THE YEAR ENDED 31ST MARCH, 1965.
Bristol Avon River Board; Severn River Board.

46 pp, 2 pl; and 56 pp, 2 pl.

Descriptors: *Water pollution control, Sewage treatment, Data collections, *Standards, *Storm runoff, Sewage effluents.
Identifiers: *Suspended solids, Bristol (Great Britain).

These reports each contain information on water resources and the prevention of pollution, including the characteristics of the water and the treatment of sewage and trade waste waters. Tabulated data are included from surveys of the rivers Severn and Avon and their tributaries; and for the Bristol Avon area, the classification of the watercourses is compared with that reported in 1958. In the Severn area, a high standard has been adopted for settled storm sewage, limiting the concentration of suspended solids to 100 p.p.m. based on the average of three consecutive samples. Owing to the excessive amounts of suspended matter often found in effluents from package sewage-treatment plants, the Severn River Board request that land treatment should be provided for these effluents. Recommendations have also been made regarding the design of oil-storage tanks to prevent pollution caused by accidents or misuse.
W69-01518

NORTHUMBERLAND AND TYNESIDE RIVER BOARD. ANNUAL REPORTS FOR THE YEARS ENDED THE 31ST MARCH, 1962 AND THE 31ST MARCH, 1963.

56 pp.

Descriptors: *Water pollution control, Water quality, *Standards, Sewage effluents, *Overflow, *Storm runoff.
Identifiers: *Storage tanks, *Suspended solids, *Great Britain.

These reports each contain a section on the prevention of pollution, with information on the quality of river water, instances of pollution and fish mortality, and remedial action, including a summary of new and projected schemes of sewage disposal. Average data obtained in analyses of the more important rivers and streams are appended. Standards for sewage effluents and trade waste waters are outlined. A new standard has been imposed requiring that effluents from storm-water tanks at sewage works shall not contain more than 100 p.p.m. suspended solids. It is not, however, considered practical to impose a standard on the storm-water overflows on sewage systems.
W69-01519

ANNUAL REPORTS OF THE SEVERN RIVER BOARD AND THE WYE RIVER BOARD FOR THE YEAR ENDED 31ST MARCH, 1963.

70 pp.

Descriptors: *Water pollution control, *Standards, Sewage effluents, *Biochemical oxygen demand, *Storm runoff, *Overflow.
Identifiers: *Combined sewers, *Capacity, *Great Britain.

These reports each contain sections on water resources, fisheries, and prevention of pollution. The basic standards for effluents are summarized; they have remained unaltered except that, following a decision by the Ministry of Housing and Local Government, no limitation is now imposed on the B.O.D. of discharges of partially-treated sewage or storm water. Progress in the construction of works to alleviate pollution of the Severn river system has been satisfactory but in many cases full advantage of the new sewage works cannot be taken in storm time until improvements to the main sewerage system have also been carried out. A number of sewage authorities have accepted the policy of the Severn River Board for reducing the storm product in combined sewers by the selective elimination of surface water, and the enlargement of main sewer capacities will permit closure of certain overflows. New storm overflows are not permitted except in exceptional circumstances.

TO RESTORE LAKE ERIE BEACHES.

ASCE - San Eng Div, Newsletter, p 6, May, 1968

Descriptors: *Recreation facilities, *Water pol tion control, *Overflow flow control, *Chlori tion, Discharge (Water).
Identifiers: *Combined sewers, *Cleveland (Ohi *Lake Erie, *Interceptor sewers, Capac *Polymers, *Sewer flushing.

Cleveland, Ohio is attempting to restore some of Lake Erie beaches polluted by overflows of co bined storm and sanitary sewers. Methods under vestigation are: (1) the use of polymers to red overflows from the Edgewater sewer by increas the flow-carrying capacity of the Westerly in ceptor sewer; (2) hypochlorination of the ma overflows and creek waters entering Lake Erie; flushing sewers during dry weather to reduce

ischarge of solids when it rains; (4) screening of verflows and streams.
V69-01536

A PLAN TO HELP LAKE ERIE.

ASCE - San Eng Div, Newsletter, p 5, Jan 1967.

Descriptors: *Overflow, *Construction, *Sewage agoon, Sewage treatment.
Identifiers: *Cleveland (Ohio), *Storage tanks, Combined sewers, *Lake Erie.

The feasibility of building a large waste-water hold-ng and treatment reservoir in Lake Erie for com-ined-sewer overflows in Cleveland is being stu-ied. The possibility of building a deep detention acility off the shore of Lake Erie is being in-estigated because of the high cost of acquiring aluable lakefront land there. Construction echniques will be analyzed and the best methods f operation to assure flexibility of use and efficien-y of treatment will be recommended. If this proves o be feasible, the lagoon may provide further treat-ient of the wastes from Cleveland's Easterly econdary-treatment plant and flows from storm ewers in this section of the city.
V69-01537

FEDERAL GRANT TO HELP RESTORE CLEVELAND BEACHES.

Civ Eng, Vol 38, No 6, p 85, June 1968.

Descriptors: *Recreation facilities, *Overflow, low control, *Chlorination, Storm runoff, *Water ollution control, Discharge (Water).
Identifiers: *Combined sewers, *Cleveland (Ohio), Polymers, *Lake Erie, *Sewer flushing, *Inter-eptor sewers, Capacity.

Cleveland, Ohio has received a grant to restore eaches polluted largely by overflows of combined ewers and to expand recreational opportunities for he area. Control and treatment methods to be used n this project include: experimental use of olymers to reduce overflows from the combined ewers by increasing the flow-carrying capacity of nterceptor sewers; hypochlorination of the major verflows and creek water entering Lake Erie; im-lementation of a sewer-flushing program during ry weather to reduce the discharge of solids when t rains; and screening of overflows and streams.
V69-01538

MILWAUKEE SEEKS TO SOLVE POLLUTION PROBLEM.

Civ Eng, Vol 37, No 9, p 79, Sept 1967.

Descriptors: *Storm runoff, *Overflow, *Chlorina-ion, *Chemical analysis.
Identifiers: *Milwaukee (Wis.), *Storage tanks, Combined sewers, *Bacteriological sampling.

Milwaukee will construct a huge underground oncrete tank to catch rainstorm overflow from the ombined sanitary-storm sewer system. The emonstration tank will be 170 ft. long, 130 ft. vide, and 30 ft. deep, and will hold 3.9 million gal-ons. The tank is being designed to catch the runoff, urify it with chlorine, or hold it until the storm nds. Then the runoff will gradually be drained ack into the combined sewer system, which flows o the treatment plant. In addition to this demon-tration project, the quality and quantity of the ombined flow, including a physical, chemical and acteriological analysis of the combined waste, will e made in an effort to determine when the sewers verflow or for how long.
W69-01539

NEW ORLEANS HAS GRANT TO TREAT STORM WATER.

Civ Eng, Vol 37, No 3, p 103, Mar 1967.

Descriptors: *Storm runoff, Recreation facilities, *Water pollution, *Overflow, *Chlorination.
Identifiers: Grants, *Storm sewers, *New Orleans (La.), *Urban drainage.

Lake Pontchartrain beaches now have to be closed after heavy summer rains when storm water, with a high bacterial count, is pumped from the canals in New Orleans into the lake. Although New Orleans has separate storm-water and sewer systems, some overflow from the sewers into the canals carrying rain water does occur. In addition, the canal waters are contaminated by dirt washed off the streets during rains. A demonstration project is being initiated to study the injection of chlorine into storm waters in four open canals discharging into the lake. At one of the chlorine-injection stations a special concrete chamber, 1,300 ft. long, 85 ft. wide, and 14 ft. deep, will be built in a canal to assure that the chlorine will be adequately mixed with the storm waters. The project also involves the construction of a chlorine-blending plant to avoid the potential hazard of using the disinfectant in its gaseous form.
W69-01540

IMPROVEMENTS TO SEWAGE TREATMENT AT BATH.

Civ Eng and Pub Wks Rev, Vol 63, No 738, p 70, Jan 1968.

Descriptors: *Sewage treatment, *Pumping, *Storm runoff.
Identifiers: Capacity.

Modifications to the City of Bath's sewage treatment system include the provision of new storm sewage treatment plant adjacent to their pumping station at Twerton, the plant now being designed to deal with some 17 m.g.d. under storm conditions, while a further 10.5 m.g.d. will be pumped 5 miles through a 30 in. rising main to the main treatment plant at Saltford. In order to connect the new pumping capacity, a temporary pumping was required to handle the full flow of sewage, so that the wet well could be isolated and work on connecting pipe work be carried out. For this purpose, the inlet chamber, measuring 6 ft x 5 ft. was converted to a sump to receive the full flow of sewage and 5 sykes 6 in. Univac pumps, working on a total suction lift of 25 ft. were installed. Normal peak mid-day and evening flows handled by the pumps are of the order of 250,000 gal/hr. With the wet well isolated, the 3 ft. thick dividing wall of the well was cut through using the ladder drilling method with holes at 4 in. centers being cut down by paving breakers to give an opening of some 4 ft. 6 in. square section. Old pipe sections which had to be removed were maneuvered through this opening by chain block and tackle before the new 24 in. dia. suction branches could be replaced.
W69-01541

ELMBRIDGE WATER POLLUTION CONTROL WORKS.

Civ Eng and Public Wks Rev, Vol 62, No 734, p 997, Sept 1967.

Descriptors: *Storm runoff, *Overflow, *Sewage treatment, *Sedimentation, *Sewage sludge, Equipment.

The new sewage disposal works at Cranleigh will deal with sewage flows up to 3 x D.W.F. and all storm flows will be treated in the old works which have been modified. At the storm overflow chamber, flows in excess of 3 x D.W.F. are overflowed to the old works for treatment in the sedimentation tanks, biological purification on four filters and secondary settlement in the humus tanks before discharge to the Cobblers Brook. In order to deal with these storm water flows, the first of the three sedimentation tanks has been equipped with a sludge scraping mechanism and the other two tanks have a ridged floor formed by precast concrete units to facilitate the removal of the sludge settling in these tanks. The old filters have had new revolving distributors fitted and arrangements have been made to trickle feed these filters with settled sewage during dry weather. In this way, the micro-organisms which must be present to effect biological purification will be kept alive and the filters ready to treat the excess flows in wet weather.

SEATTLE SEES VICTORY IN ITS BATTLE AGAINST POLLUTION.

Eng News Rec, Vol 174, No 23, pp 44-46 and 51, 1965.

Descriptors: *Overflows, Sewage treatment.
Identifiers: *Storage tanks, Storm sewers.

The comprehensive sewage-disposal facilities planned for Seattle, Wash., to reduce pollution of Lake Washington and coastal waters of Puget Sound are outlined; the Renton and West Point treatment plants are now in operation. Some pollution is still likely to occur as a result of overflows of storm sewage; one proposal to reduce this is construction of holding tanks near Lake Washington
W69-01545

CITY PLANS TO TREAT STORM WATER.

Eng News Rec, Vol 172, p 22, May 28, 1964.

Descriptors: *Storm runoff, *Chlorination, *Overflow, Recreation facilities, Design, Estuaries.
Identifiers: *Storage tanks, *Storm sewers, Capacity, *New York (N. Y.).

Describes the 'Marginal Pollution Control Program' for New York City in and around Jamica Bay, Eastchester Bay and the Upper East River. Large detention tanks are being constructed with chlorination facilities at the storm sewer overflows. Tanks are designed to capture an estimated 25 of 40 summer storms with 15 overflowing. The initial phase of construction for Jamaica Bay will include 4 storm water detention tanks serving 12,663 acres. The above program is designed for protection of the cities bathing beaches.
W69-01546

UNDERWATER STORAGE OF STORM OVERFLOW.

Environ Sci Technol, Vol 2, No 9, p 668, Sept 1968.

Descriptors: *Overflow, *Storm runoff, Design, *Flowmeter, Sewage sludge, Pumping.
Identifiers: *Combined sewers, *Storage tanks, *Washington, D. C., *Interceptor sewers, Suspended solids.

The feasibility of storing overflow of combined sewers in inflatable tanks anchored to the bottom of a river bed is being studied by a pilot project in the Anacostia River in Washington, D. C. The project is intended to demonstrate that this approach can capture, handle, store, and return overflow to the interceptor sewer without the overflow ever touching the river. The tanks are made of synthetic rubber impregnated with nylon fabric. They measure 120 x 20 feet, and stand between 6 and 7 feet high when inflated. In operation, the system will work this way: storm overflow passes through a Parshall flume where the volume is measured and recorded. At a predetermined level, a butterfly opens to allow influent to enter a grit chamber, where oils and grease float to the top and are skimmed off. The flow passes through a comminutor which shreds all solids down to 3/8 inch. The flow then moves by gravity to the storage tanks. When it is ready to be pumped back to the interceptor, compressed air is used to prevent sludge buildup.

UNDERWATER TANKS WILL STORE RUNOFF WATER.

Environ Sci Technol, Vol 2, No 3, p 169, March 1968

Descriptors: *Storm runoff, *Overflow, Design.
Identifiers: *Storage tank.

Underwater tanks to store excess sewage and runoff waters during overflow conditions will be designed, constructed, and operated by Melpar, Inc. The stored water will be returned to the municipal treatment plant when conditions are more favorable. The tank will be located on the river bottom several hundred feet from shore and will not be a hindrance to navigation.
W69-01548

NEW ORLEANS TRYING DISINFECTION OF STORM-SEWER DISCHARGES.

Publ Wks, N Y, Vol 98, No 3, p 139, 1967.

Descriptors: *Storm runoff, *Chlorination, Recreation facilities.
Identifiers: New Orleans (La.), Storm sewers.

Pollution of Lake Pontchartrain through the discharge of storm sewage from New Orleans into canals, has occurred, leading to closure of the beaches after heavy rains when the canal contents are pumped into the lake. To remedy this, it is planned to chlorinate the storm sewage in the canals.

MILL GREEN SEWAGE DISPOSAL WORKS EXTENDED.

Survr Munic Cty Engr, Vol 129, No 3912, pp 27-28, 31, 1967.

Descriptors: *Storm runoff, Treatment.
Identifiers: Storage tanks.

An illustrated description is given of recent extensions to the Mill Green sewage works of Hatfield R.D.C., Herts., which serve the northern part of Hatfield and neighbouring villages. The new works, designed for a flow of 1 m.g.d., include increased pumping capacity, additional percolating filters and 3 microstrainers for tertiary treatment of humus-tank effluent before discharge to the river Lee. Storm sewage is returned for full treatment after storage. After two-stage digestion, sludge is dried on beds.
W69-01550

WORTHING'S L500,000 SCHEME OF DRAINAGE IMPROVEMENTS.

Surveyor, London, Vol 121, pp 1069-1070, 1962.

Descriptors: Storm runoff.
Identifiers: *Storage tanks.

Improvements are being made at the overloaded sewage works of Worthing, Sussex, where previously sewage was discharged to sea after screening and chlorination. At the West Worthing works, which will treat a dry-weather flow of 1.31 m.g.d., the screens are being replaced by comminutors, and sedimentation tanks and new storm-water tanks are being constructed. At the East Worthing works (which will have a dry-weather flow of 3.14 m.g.d.) improvements include the enlargement of the existing pumping station, installation of a comminutor, conversion of the existing tidal storage tanks to storm-water tanks, and construction of new storage tanks. The effluents will be discharged over a tidal period of 8 1/2 hours. Sludge from both works will be combined with refuse and sold as compost.

CALCUTTA. 2. A SANITARY ENGINEERING APPROACH TO A MULTIPLICITY OF PROBLEMS,
P. C. Bose, and R. G. Ludwig.
Water Sewage Works, Vol 112, pp 164-167, 1965.

Descriptors: *Flood control, Drainage systems, *Design, Storms, Sewage treatment, *Storm runoff.
Identifiers: *Capacity, *Combined sewers, *Storm sewers, Calcutta (India).

To improve the sewerage system at Calcutta and alleviate flooding during the monsoon period it is proposed to increase the capacity of the existing combined sewers and drainage channels, provide connexions to the trunk sewers, and construct separate sewers for storm water and sewage in the unsewered districts, using 2-month storm frequency data as a design basis for the urban sections. Treatment works are planned for the districts of Tollygunge, Cossipore-Chitpore, Howrah, and Chandernagore.

UNIT HYDROGRAPH CHARACTERISTICS FOR SEWERED AREAS,
Peter S. Eagleson.
ASCE Proc, J of Hydr Div, Vol 88, No HY2, Part 1, March 1962.

Descriptors: *Hydrographs, *Overflow, Sewers, Storms, Drainage.
Identifiers: *Storm sewers.

Hydrographs of measured storm sewer outflow from urban areas up to 7.5 sq. miles in size are analyzed. The characteristics of the hydrographs are correlated with the properties of sewers and drainage basins in order to permit construction of synthetic unit hydrographs for other unmeasured sewered areas. Applicability of the derived relationships is tested against a measured outflow hydrograph for a complex storm.

5E. Ultimate Disposal of Wastes

KREMEYER V SHUMATE)DEBRIS-PLUGG DRAINS(.

20 111 App 2d 542, 156 N E 2d 271-274 (1959)

Descriptors: *Illinois, Judicial decisions, Del avalanches, *Garbage dumps, *Landfills, Gull Ravines, Ditches, Drains, *Damages, Fouli Flood damage, Floods water injury.

Defendants, operators of a scavenger busin deposited garbage, debris and junk on their prop ty. A portion of this debris was used to fill ditc and gullies in which a ravine terminated. A sev rain washed debris from the dumping place carried it down through the ravine onto plaint property, where the water-borne debris plugged the end of a drainage pipe running beneath pl tiffs' front yard. Plaintiffs' sued for damages to t property from flooding allegedly caused by plugging of the pipe. The court awarded plaint a reasonable amount to unplug the drain but de any recovery for permanent damage to the property, holding that plaintiffs had not satis their burden of establishing a causal connec between the negligent piling of the garbage and eventual damage to improvements on plaint land.

POWER OF MASSACHUSE METROPOLITAN DISTRICT COMMISSION
Mass Ann Laws ch 92, secs 75-79 (1967).

Descriptors: *Massachusetts, *Administrat *Water permits, *Eminent domain, Legisla Administrative agencies, Cities, Water pollut Pollution abatement, Construction, Water p tion sources, Sewage disposal, Industrial w Government finance, Water utilization, W levels, Water quality, Drainage, Sewers, Rese tion doctrine.
Identifiers: Harbor masters, Public hearings.

Section 75 empowers the Metropolitan Dis Commission to appoint a harbor master assistant harbor masters to exercise auth within the Charles river basin. Section authorizes the commission to order the remov

sewage and other polluting matter from the harles River. Section 76A gives the commission thority to issue permits for the taking of water om the Charles river basin for the purposes of fire otection and sale to manufacturing establishents. Specified conditions must be met before a rmit is issued. Section 76B specified conditions der which the permit is granted; violation of any ndition is ground for revocation. Sections 76C d 76D pertain to suitable connections for use of y water in case of revocation, and to mainnance of the water level in the river basin. Sec- n 76E permits cities to borrow money to finance nstruction of water works. Section 77 empowers e commission to take by eminent domain any nds for the purpose of sewage disposal. Section deals with eminent domain powers for construc- n, maintenance, and operation of a system of etropolitan water works. Section 79 deals with minent domain for reservations. (Smodish-Fla)

EUTROPHICATION AND WATER POLLUTION,
Federal Water Pollution Control Administration, Washington.
Edward J. Martin, and Leon W. Weinberger.
Publication Number 15, Great Lakes Res Div, Univ Mich, pp 451-469, 1966. 19 p, 4 fig, 8 tab, 45 ref.

Descriptors: *Eutrophication, *Nutrients, Pollutants, Pollution abatement, Nuisance algae, Phosphates, Nitrates, Rivers, Sewage treatment, Water pollution sources, Primary treatment, Secondary treatment, Tertiary treatment, Electrodialysis, Ion exchange, Activated sludge, Denitrification.

Authors define the mechanism of eutrophication and evaluate probable sources and nature of the pollutional loads responsible for accelerated eutrophication. This involves considerations of types and quantities of nutrient material, especially nitrogen and phosphorus, in terms of control and the frequency and intensity of algal blooms. On rivers, between 1961 and 1963, 49% of 130 stations reported algal counts which could be defined as blooms; 55% of 345 stations reported values of phosphate equaling or exceeding 0.2 mg/1. Wastes resulting from municipal, agricultural, and industrial uses of water contribute significant amounts of nutrients that may promote eutrophication in waterways. About 235 to 2,350 tons of phosphate are discharged daily to receiving waters from municipal waste sources in the US alone. Maximum efficiences of seven treatment processes for removing nitrogen and phosphorus are reviewed. 50% of total phosphorus and 80% of total nitrogen are removed by use of an activated-sludge process, while 99+% of the phosphorus and nitrogen are removed with a treatment sequence using ion exchange. These data indicate that treatment capabilities are available to control the discharge of nutrient compounds from point sources of wastes and to treat them to almost any desired degree.

A STUDY OF THE INTERACTIONS AND FOAM FRACTIONATION OF SEWAGE EFFLUENT--ACID MINE DRAINAGE MIXTURES,
Pennsylvania State University, University Park.
Robert C. Streeter, and Daniel C. McLean.
Water Resour Res Publ No 6-66, Pa State Univ, 1966. 51 p, 7 fig, 6 tab, 28 ref. OWRR Project A-004-Pa.

Descriptors: *Sewage, *Sewage treatment, Sewage effluents, Foams, Oxygen demand, Aeration, pH, Waste water, Waste disposal, Laboratory equipment, Oxygen requirements, Dissolved solids, *Surfactants, Acid mine water, *Mine drainage, *Foam fractionation.

This report encompasses removal of surfactants (derived from sewage effluent) and iron salts (derived from acid mine drainage waters) from contaminated Pennsylvania streams by foam fractionation techniques. Introduction of biodegradable surfactants to the market shortly after project initiation caused the foaming characteristics of treated domestic sewage effluents to be so poor as to obviate foam fractionation. However, a simple conbination of excess volume of sewage effluent with acid mine drainage (AMD) was found to result in significant water purification interactions. Sewage effluent-AMD mixtures were subjected to aeration, fluid-solid separation, and foam fractionation in a continuous process involving relatively short retention times and utilizing inexpensive equipment. Desirable results of this treatment are given. Precipitation of ferric hydroxide, which occurs when sewage effluent-AMD mixtures are neutralized, results in removal (by co-precipitation or absorption) of certain objectionable inorganic anions and refractory organic materials normally resistant to conventional sewage treatment. The average sewage treatment plant should be able to handle the quantities of AMD involved without loss of treatment capability or decrease in capacity, in fact, an increased capacity should be experienced.
W69-01227

HANDBOOK OF POLLUTION CONTROL COSTS IN MINE DRAINAGE MANAGEMENT.
Fed Water Pollut Contr Admin, Dec 1966. 54 p, 13 fig, 2 tab, 49 ref.

Descriptors: Mine water, Economics, Costs, *Mine drainage, *Mine wastes, Strip mines, Grouting, Strip mine wastes, Coal mines, Coal mine wastes, Acid mine water, *Pollution abatement, Waste disposal.
Identifiers: *Monongahela River Basin, Monongahela River (Pa).

The information presented in this publication answers a need of the Monongahela River Mine Drainage Remedial Project for preliminary cost data in determining relative costs of mine drainage abatement. Costs of remedial measures are listed and evaluated on a unit price basis. They cover a period of 33 years from 1933 to the present time. These include unit costs on such items as mine seals or bulkheads; surface reclamation of strip-mines along with associated planting; reclamation of refuse areas; drainage diversion and impoundment; and treatment of mine drainage. Methods examined are grouped into those dealing with underground mine drainage, surface mine drainage, drainage from refuse and waste disposal areas, and control and treatment of water in active mining situations.

WATER TRANSLOCATION OF DIAZINON-CARBON 14 AND PARATHION-SULFUR 35 OFF A MODEL CRANBERRY BOG AND SUBSEQUENT OCCURRENCE IN FISH AND MUSSELS,
Massachusetts University, Cranberry Experiment Station, East Wareham.
C. W. Miller, B. M. Zuckerman, and A. J. Charig.

Rep Trans Amer Fisheries Soc, Vol 95, No 4, pp 345-349, Oct 1966. 5 p, 2 tab, 9 ref, disc. OWRR Project A-010-Mass.

Descriptors: *Pesticides, Fish physiology, Pesticide toxicity, Fish, *Diazinon, Translocation, Runoff, Metabolism, *Pesticide residues, Mussels, *Cranberries, Bogs.

Transportation of diazinon-carbon 14 and parathion-sulfur 35 off a model cranberry bog following a simulated rost protection flood was shown 24 hr after application of the chemicals. Fish and fresh water mussels were exposed to these contaminated waters and analyzed periodically. The majority of the chemicals disappeared from the water after 144 hr. During this time, no labeled metabolites of diazinon were detected; however, three labeled parathion degradation products were encountered. Accumulation of both pesticides occurred in the fish and mussels, often to levels far in excess of that present in the waters. The fish appear able to metabolize these accumulated chemicals at a faster rate than the mussels.

THE EFFECTS OF WEIRS ON THE AERATION OF FLOWING STREAMS,
Rhode Island University, Kingston.
Warren M. Hagist.
Water Resour Center Completion Rep, Univ R I, June 1967. 8 p. OWRR Project A-007-RI.

Descriptors: *Aeration, *Weirs, Channel flow, Oxygen, Waste water treatment, Laboratory tests.

The purpose of the research was to perform a systematic investigation of the effect of weirs on the aeration of flowing streams. The experiments were performed in a rectangular laboratory channel using (1) a single suppressed weir with and without a downstream step of variable height and width, (2) two suppressed weirs in tandem, (3) a single contracted weir with and without a downstream step of variable height and width. The upstream and downstream oxygen concentrations were measured with a continuous reading oxygen analyzer. For the weirs without steps maximum oxygen pick-up occurred when the depth of the downstream water was about 1/3 the weir height. The presence of the downstream step doubled the aeration efficiency. The width of the step made almost no difference, but a step height of between 3/4 and 5/6 the weir height produced maximum aeration. Aeration efficiency of weirs is low, but their low installation and operating costs are attractive. (Author)

WATER POLLUTION - ECONOMIC ASPECTS AND RESEARCH NEEDS,
Allen V. Kneese.
Washington, D. C. Resources for the Future, 1962. 107 p, 104 ref, 2 append.

Descriptors: Impaired water quality, Pollutant identification, Public health, *Water pollution, *Water pollution effects, Water pollution sources, Pollution abatement, *Water pollution treatment, Water quality control, Social aspects, Economic efficiency, Economic impact, River basin development, *Model studies, Analytical techniques, Optimization, Optimum development plans, Operations research, Water pollution control, Sewage treatment.

The economic consequences of water pollution are discussed thoroughly. An economic framework is established to determine research needs. The nature, effects, treatment and alternatives to treatment of water pollution are delineated. Economic efficiency and social policy are discussed in relation to the pollution problem, and individual values and social values are evaluated. It is concluded that the results of unregulated wastes disposal into bodies of water fail to coincide with the attributes of an ideally functioning market system. It is suggested that a broad goal of public policy should be to minimize the social costs associated with wastes disposal. Research needs are discussed primarily in light of the complex problems involved. Computational and scientific problems, deficiencies in technical and economic knowledge, and problems in devising procedures for approximating optimum systems are examined. Several lines of investigation are suggested, and areas in which critical improvements in knowledge are needed are identified. (Pfeiffer-Fla)

AN ACT TO AMEND SECTION 16 OF 'AN ACT TO ESTABLISH A SANITARY WATER BOARD AND TO CONTROL...POLLUTION...'

Illinois Laws ch H 1177 (1967).

Descriptors: *Illinois, *Legislation, *Water pollution control, Cities, *Administrative agencies.
Identifiers: Federal Water Pollution Control Act, Sanitary districts.

An act establishing the Sanitary Water Board in Illinois is herein amended. The effect of the amendment is to allow the board to set and enforce water quality standards for existing sanitary districts with populations of 1,000,000 or more; specifically, the Metropolitan Sanitary District of Chicago. This statewide control by the board is required for Illinois to receive benefits under the Federal Water Pollution Control Act. (Sisserson-Fla)
W69-01314

AN ACT...RELATING TO WATER RESOURCES, THE WATER POLLUTION CONTROL ACT, AND...DUTIES...OF THE DIVISION OF WATER RESOURCES AND THE WATER RESOURCES BOARD.

Laws of West Virginia 1967 ch 143.

Descriptors: Legislation, Water law, Water control, Public health, Administrative agencies, *West Virginia, State governments, Water policy, Water resources development, Water flow, Permits, *Environmental sanitation, Water purification, Water pollution, Water resources, *Pollution abatement, Water pollution treatment, Industrial wastes, *Water pollution control, Sewage treatment, Sewage disposal.

This act amends the code of West Virginia pertaining to water pollution control. The act provides a general declaration of policy reflecting primary concern for the protection of public health and preservation of natural water resources. In addition, it encompasses definitions of terms used; the general powers and duties of the chief of the division of water resources and the water resources board with respect to water pollution; requirements for permits for specified activities; applications for and forms of permits; permit fees; procedures concerning permits; the transfer of permits; orders of the chief to stop or prevent discharges or deposits orders of the chief to take remedial action; service of orders; duty to proceed with remedial action upon receipt of permit; progress reports; finances and funds; appeals to and review procedures before the water resources board; circuit courts and the supreme court of appeals; actions to abate nuisances; injunctive relief; violations; and criminal penalities. (Kuder-Fla)
W69-01317

AN ACT...RELATING TO THE APPOINTMENT OF VOLUNTARY WATER QUALITY MONITORS.
West Virginia Laws ch S 334 (1967).

Descriptors: *West Virginia, Legislation, Administrative agencies, *Water quality control, *Water pollution control, Legal aspects, Monitoring, Oversight data collections, *Sampling, Water analysis, Pollutant identification.

Section 8A was added to Article 5A, Chapter 20 of the Code of West Virginia (1931). Article 5A was entitled the 'Water Pollution Control Act.' The new section authorizes the appointment of volunteer water quality monitors. These monitors are to take samples of the waters of the state and forward them to the state water resources chief for analysis. The monitors are to be provided with training and equipment to perform these duties. They are to be paid fifty cents for each sample. These samples are admissable in all state courts for the purpose of enforcing the pollution laws. (Sisserson-Fla)

CITY OF UTICA V WATER POLLUTION CONTROL BD)AUTHORITY OF WATER POLLUTION CONTROL BOARD(.
5 NY 2d 164, 156 NE 2d 301-306 (1959).

Descriptors: *New York, Judicial decisions, Administrative decisions, Local governments, State governments, Water pollution, *Pollution abatement, *Public health, Abatement, Classification, Standards.

The state legislature passed a water pollution control law that directed the defendant water pollution control board to employ experts to classify waters of the state. When making these classifications the defendant was to consider many specifically enumerated factors. Acting under the authority of the statute, defendant adopted classifications and standards of quality and purity, and assigned the same to waters within the plaintiff's area. Defendant then submitted to plaintiff a pollution abatement plan. Plaintiff did nothing to abate the pollution for two years, at which time defendant charged plaintiff with violating sections of the public health law. Plaintiff then brought this action to restrain defendant from acting on the ground that the water pollution law was unconstitutional. The court held that the act was a valid delegation of authority by the legislature, and that it provided adequate standards for the board's guidance. The legislature cannot confer discretion upon an agency if, as was done here, it had stated an intelligible principle or specified the standards and guides in as detailed fashion as is reasonably practicable in the light

ne complexities of the particular area to be regu-ated. The court affirmed the dismissal of plaintiff's ction. (S. Scott-Fla)

IETHODS FOR HARVESTING OR CONTROL F AQUATIC PLANTS,
Visconsin Univ, Madison, Water Resources enter.
ere Neil Mossier.

escriptors: *Eutrophication, *Harvesting, Aquatic weed control, *Lakes, Ecology, Primary roduction, Aquatic habitats, Sediment control, Vater quality control, Vegetation, Watershed anagement, Plant growth, Vegetation regrowth, cuba diving, Wisconsin.
dentifiers: Lake Mendota, Ceratophyllum, Myriophyllum, Vallisneria.

nalysis of three 800-sq-m submerged stands in ake Mendota, Madison, Wis, demonstrated har-esting submergent macrophytes to be a feasible ontrol procedure. Two stands with Myriophyllum albescens dominant and Ceratophyllum demer-um subdominant were subjected to variable har-est treatments from June through August. Myriophyllum at water depths of 1.4-2.1 m was ontrolled by one harvest; mid-July harvest ap-eared most effective. Myriophyllum at 1.0-m epth required two harvests; June-August com-ination appeared best. With decreasing depth, ate of macrophytic growth increases, making more requent cutting necessary. Vallisneria americana t 1.0-1.6 m required only one harvest regardless of epth. Two transects were harvested mechanically. Growth responses of Myriophyllum and Ceratophyllum in these corresponded to responses f plants cut with hand sickles using SCUBA. An conomical system to utilize the harvested crop is eeded. New uses for Myriophyllum as animal feed r fertilizer may encourage investments in echanical harvesting. Complete removal of plants rom University Bay is not a sound ecological ven-ure. Macrophytes reduce the distance silt and uspended matter are carried into the lake system nd provide for biotic needs. The possibility of verharvesting is real; change in species composi-on with change in the environment is inevitable. Harvesting measures must be ecologically sound.

STANDARDS, CHARGES, AND EQUITY,
Resources for the Future, Inc.
Allen V. Kneese, and Blair T. Bower.
Managing Water Quality: Economics, Technology, Institutions, Baltimore: Johns Hopkins Press, 1968, Chap. 7, p 131-142, 3 fig, 3 ref.

Descriptors: *Water quality control, *Economic efficiency, Administrative costs, Comparative costs, Economic evaluation, Competing uses, Optimum development plans, Economic justification, *Marginal costs, Market value, Payment, Water costs, Variable costs, Institutional constraints.
Identifiers: Effluent charges, Equity.

Possible standards for water quality in streams, lakes, and estuaries are discussed. 'Complementarities' in treatment or other measures for reduction of waste discharges are reviewed with consideration of effluent standards. The effluent charge can be used to achieve stream water quality standards efficiently, i.e. at lowest economic or resource cost. Each waste discharger is charged in proportion to the use he makes of a resource - the waste assimilative and transport capacity of the watercourse. The waste discharger can compare his marginal costs and marginal charges and decide whether it pays him to reduce his waste and to what degree. The revenue that accrues to the agency from the charges can be viewed as a rental return on a natural resource. Ideally, charges should be levied on all activities which reduce water quality sufficiently to impose external costs, but this may not be administratively feasible. A discussion of the equity of charges which focuses on the distribution of costs of water quality management is presented. (Gargola-Chicago)

REPORT ON MULTILEVEL OUTLET WORKS AT FOUR EXISTING RESERVOIRS,
Bureau of Reclamation, Denver, Colo., and Sacramento, Calif.
Garry H. Austin, Donald A. Gray, and Donald G. Swain.
Pap Selec Withdrawal Reservoirs ASCE Hydraul Div conf, Cambridge, Mass, Aug 1968. 38 p, 12 fig.

Descriptors: *Outlet works, *Outlets, *Water quality, Multiple purpose reservoirs, Intake gates, Intake towers, Intake structures, Discharges, Fish and wildlife, Reservoir operation, Hydraulic structures, Hydraulic gates and valves, Fish.
Identifiers: *Multilevel outlets, Water temperature, Water use, *Water quality control, Salmon, California, Selective level releases.

Design and performance of 4 multilevel outlet works constructed by the Bureau of Reclamation are discussed. The need for water quality control by selective reservoir releases has increased as more multipurpose reservoir applications have combined such diverse uses as irrigation, power generation, flood control, municipal and industrial water supply, fish and wildlife, recreation, and navigation. The 4 reservoirs (Cachuma, Casitas, Folsom, and Whiskeytown) have been in operation from 6 to 13 yr and present some variation in water quality situations and outlet designs. Cachuma and Casitas Reservoirs are thermally stratified during summer. Taste and odor requirements have governed the withdrawal level selection, but chlorine demand, temperature, and dissolved oxygen are considered. Modifications were made at Folsom Dam after completion to allow withdrawal of reservoir water from upper and lower levels. Salmon spawning requirements downstream from Folsom fix the maximum water temperature at 58 deg F. Selective withdrawal provisions at Whiskeytown Dam were planned for temperature control of releases to Clear Creek, a salmon spawning stream. (USBR)

RECLAIMED WATER WILL HELP FILL LAKES.

Publ Wks, N Y, Vol 96, No 3, pp 82-83, 1965.

Descriptors: *Storm runoff, Drainage, Tunnels, Design flow, *Water reuse.
Identifiers: Combined sewers, Minneapolis, Minn.

Details are given of a proposal to use storm water and water discharged from air-conditioning plants to maintain the levels in a chain of recreational lakes at Minneapolis, Minn., during the summer months. By constructing a control dam in the lower portion of the existing system of drainage tunnels, 2.6 mil. gal of water can be impounded. The dam will be fitted with a sluice gate which will permit periodic flushing of the system, and will open automatically during heavy rainfall. The air-conditioning water is of good quality, and precautions will be taken to avoid interconnexions between the tunnels and the city's combined sewerage system. It is estimated that, in spite of variations in flow, the design flow of 22 ft (3) per sec can be maintained during most of the 100-day period when it is intended to divert water to the lakes.

WATER POLLUTION RESEARCH, 1965.
Great Britain Ministry of Technology.

London, H M Stationery Office, 1966. 224 p, 4 plates.

Descriptors: *Storm runoff, Sewage treatment.
Identifiers: Great Britain.

This report contains information on work carried out at the Water Pollution Research Laboratory during 1965, including investigations on the activated-sludge process and biological filtration; biological decomposition of synthetic detergents; role of protozoa in biological treatment processes; ecology of invertebrates in filters; sedimentation of sewage and humus; factors affecting digestion and dewatering of sludge; volume and composition of storm sewage; treatment of humus-tank effluent in pebble-bed clarifiers; recovery of water from sewage effluents; treatment and disposal of various types of trade waste water; effects of pollution on fish; oxygen balance in streams; control of water weeds and midges; growth of sewage fungus in streams; dispersion of sewage from sea outfalls; and development of analytical methods and instruments. A list of papers published during the year is appended.

WATER POLLUTION RESEARCH, 1964.
Great Britain Ministry of Technology.

London, H M Stationery Office, 1965. 182 p.

Descriptors: Sedimentation, *Storm runoff, *Biochemical oxygen demand, *Chemical analysis, Flow measurement.
Identifiers: *Suspended solids, *Great Britain.

This report contains the results of investigations on the following subjects: (1) aerobic biological treatment of sewage and industrial wastes; (2) sedimentation processes; (3) sludge treatment; and (4) sewage. The data obtained on the flow and composition of storm sewage at Brighouse, Yorkshire have been analyzed. Although the B.O.D. and con-

centration of ammoniacal nitrogen in storm sewage were lower than the dry-weather values, the concentration of suspended solids was always much higher. In general, the B.O.D., permanganate value, and ammonia content of the storm sewage discharged in the first 15 minutes were about twice as great as that discharged after the first 30-40 minutes; the reduction in suspended solids content was much less marked.

TECHNICAL PROBLEMS OF RIVER AUTHORITIES AND SEWAGE DISPOSAL AUTHORITIES IN LAYING DOWN AND COMPLYING WITH LIMITS OF QUALITY FOR EFFLUENTS MORE RESTRICTIVE THAN THOSE OF THE ROYAL COMMISSION.

Ministry of Housing and Local Government, London, 1966, 20 pp.

Descriptors: *Sewage effluents, *Standards, Dissolved oxygen, *Storm runoff, Sampling.
Identifiers: *Suspended solids, *Great Britain.

This memorandum explains the circumstances under which sewage effluents should be required to reach a standard better than that recommended by the Royal Commission. In deciding the standards to be imposed under particular circumstances, consideration should be given to the probable concentration of dissolved oxygen in the effluent and the possible need for aeration; seasonal variations in requirements; and flows to be treated, including the proportion of storm sewage to be expected. The only standard considered justifiable for discharges of storm sewage is a condition limiting the content of suspended solids, and since this concentration is highly variable it is recommended that these effluents should not be required to conform to a given standard (e.g. 100 mg per liter) all the time, but provision should be made for one or two samples out of every ten, taken on different days, to exceed the limit.

TRENDS IN FINANCIAL SUPPORT FOR WATER POLLUTION CONTROL,
North Carolina Univ., Raleigh, N. C. Water Resources Res. Inst.
David H. Howells.
ASCE Proc, J Sanit Eng Div, Vol 93, No SA3, pp 1-13, June 1967.

Descriptors: *Water pollution control, Construction, *Grants, *Legislation.
Identifiers: *Combined sewers.

The trend in Federal support of municipal waste-treatment construction is toward larger annual appropriations with higher levels of support for states providing matching funds. States should enact parallel grant-in-aid legislation to take full advantage of Federal aid in the future and maintain an influential position in water-pollution control. Rapid movement toward financial assistance for industrial waste treatment is not anticipated unless the current study by the Secretary of the Interior should add to the momentum. Effluent charges are considered unlikely if industry responds favorably to its responsibilities for water-pollution control. The Clean Waters Restoration Act of 1966 authorized 75% grants to public bodies for projects concerned with improved pollution control from combined sewers.

EFFECTS OF LAND USE ON WATER RESOURCES,
W. E. Bullard.
J Water Poll Control Fed, Vol 38, pp 645-59, April 1966.

Descriptors: *Land use, *Water quality, Sedimentation, Nutrients, *Water pollution, Runoff.
Identifiers: *Urban drainage.

Land use, among other factors, determines the quality of water produced. Erosion causes turbidity and sedimentation, lowers water quality, and damages aquatic life habitats. Fertilizers, pesticides, and other toxins and nutrients contribute to pollution. Agriculture, timber, mining, urban runoff, and recreation also are pollution contributors.
W69-01564

ECONOMIC SURFACE-WATER SEWERAGE: A SUGGESTED STANDARD OF PRACTICE,
L. B. Escritt, and A. J. M. Young.
J Instn Publ Hlth Engrs, Vol 62, 1963.

Descriptors: *Design, *Sewers, *Storm runoff, Storms, Surface runoff.
Identifiers: *Surface permeability, *Urban drainage.

In an examination of data, provided by the Road Research Laboratory, for use in the design of sewers, the authors question the conclusion that the amount by which calculated rates of runoff during storms exceed recorded rates is due to storage. They suggest that it is due to a change in impermeability of the catchment and describe an experiment, using a sheet of plate glass as a catchment, to support their views. The Lloyd-Davies method of calculation should be used, with the assumption that roofed and paved surfaces in developed areas have an impermeability of 80 per cent and not 100 per cent as the Road Research Laboratory suggests.

STATISTICAL ANALYSIS OF THE RESERVOIR STORAGE - YIELD RELATION.
Harvard Univ., Cambridge, Mass., Harvard Water Resources Group.

In Operations Research in Water Quality Management, pp 1-1 to 1-21, Feb 15, 1963. 5 fig, 3 tab, ref.

Descriptors: Computer models, Correlation analysis, Distribution patterns, Evaluation, Hydrologic data, *Reservoir design, Reservoir operation, *Statistical methods, Regression analysis, *Synthetic hydrology, Water management (Applied), Water quality control.
Identifiers: *Storage-yield relation, Serial correlation.

A discussion of the development of synthetic hydrology was presented. The objective was the efficient application of statistical techniques to available hydrologic data for reservoir planning and operation. Results of a computer study indic

ing the level of reliability of storage estimates based on masstdiagram calculations were given. A variety of statistical populations of streamflow were investigated together with a range of annual drafts. The reliability of conventional storage estimates made from streamflow records of the usual length was shown to be low. The storage required to meet any given yield was then treated as a statistical variate whose distribution has the same first three moments as the observed streamflows. Given the distribution, or its moments, the specification of storage was treated as a problem in decision making under risk. The statistical technique was found to be superior to the conventional method. One of seven chapters in 'Operations Research in Water Quality Management'. (Gysi-Cornell)
W69-01210

A METHOD OF OPTIMIZING DESIGN OF WATER QUALITY MANAGEMENT SYSTEMS.
Harvard Univ., Cambridge, Mass., Harvard Water Resources Group.

In Operations Research in Water Quality Management, pp 6-1 to 6-14, Feb 15, 1963. 22 p, 7 fig, 3 ref.

Descriptors: Operations research, Computer programs, Comparative benefits, *Analytical techniques, *Design, Optimization, *Simulation analysis, Water quality, *Water management (Applied).
Identifiers: *Method of steepest ascent, Local optimum, Response surface.

The 'method of steepest ascent' was presented as a technique for finding the optimal design of a water management system, and was applied to an illustrative problem of a settling tank design. The technique was developed and adapted to machine computation. The computer evaluated the system at a starting point chosen by a random sampling technique, corresponding to a particular set of assigned values of the decision variables (design dimensions). It determined the gain in economic efficiency resulting from a small increment applied to each variable, and computed the combination of increments that caused the most rapid increase in net benefits. The subroutine which checked the continual progress of the decision variables toward their local optimum values was shown in a flow diagram. A comparison of a hand computation and a machine computation of the problem were given. One of seven chapters in 'Operations Research in Water Quality Management'. (Gysi-Cornell)
W69-01211

APPLICATION OF DECISION THEORY TO SANITARY ENGINEERING DESIGN PROBLEMS.
Harvard Univ., Cambridge, Mass., Harvard Water Resources Group.

In Operations Research in Water Quality Management, pp 4-1 to 4-16, Feb 15, 1963. 24 p, 8 fig, 13 ref.

Descriptors: Operations research, Computer programs, *Decision making, Distribution patterns, Discount rate, Economic efficiency, Mathematical models, Data collections, Estimating equations, Probability, Septic tanks, *Statistical methods, *Sanitary engineering, *Design, Water quality control, Risks.
Identifiers: *Statistical decision theory, Adsorption fields, Economic horizon.

A mathematical model employing statistical decision theory was developed to aid in the planning of complex systems. The model used matrix algebra and response surface sampling, and featured a method for reaching decisions under risk. It was applied to the problem of sewage disposal in unsewered subdivisions. The objectives were: (1) to develop a formulation and computational routine for determining the optimal balance of septic tanks and absorption fields at each site; (2) to develop criteria for indicating the proper number and kind of tests in each subdivision, and the proper interpretation of the tests regarding adsorption field capacities; and (3) to indicate if additional data on soil characteristics was needed or economically justified. The model evaluated the costs of making incorrect decisions and of having only uncertain information. The model considered economic parameters such as discount rates and time horizons, and included financing and administrative costs. One of seven chapters in 'Operations Research in Water Quality Management'. (Gysi-Cornell)
W69-01212

MATHEMATICAL MODEL FOR DETERMINING THE OPTIMAL SIZES OF WATER TREATMENT PLANTS.
Harvard Univ., Cambridge, Mass., Harvard Water Resources Group.

In Oper Res in Water Quality Management, pp 5-1 to 5-21, Feb 15, 1963. 28 p, 9 fig, 8 tab, 10 ref.

Descriptors: Operations research, *Decision making, Discount rate, Hydraulic design, Future planning (Projected), *Municipal water, *Mathematical models, *Optimal development plans, Project life, *Statistical methods, Water demand, Water treatment, Economies of scale.
Identifiers: *Decision theory, Present value, Loss function.

A decision theory model was presented which indicated the proper size of a water treatment plant to be developed. The problem required the balancing of economies of scale in present construction against the diseconomy of unprofitable investment in excess capacity not needed for several years. The plant size that maximized economic efficiency was expressed as a function of population growth rate, per capita demand for water, the interest rate of capital investment, and the economic time horizon. Municipal water requirements were not treated as rigid constraints. Instead, a loss function which assigned economic penalties to small or medium sized water shortages was used. A hypothetical example illustrated the use of the model. One of seven chapters in 'Operations Research in Water Quality Management'. (Gysi-Cornell)

OPTIMAL TIMING OF IRRIGATION,
California Univ., Riverside; Nevada Univ., Reno.
Warren A. Hall, and William S. Butcher.
Amer Soc Civil Eng Proc, Vol 94, No IR2, pp 267-275, June 1968. 3 ref, 2 append.

Descriptors: Estimated benefits, Estimated costs, Economic efficiency, Irrigation, *Irrigation efficiency, Irrigation programs, *Dynamic programming, Digital computers, Optimization, Seasonal, *Water management (Applied), Water distribution (Applied), Wilting point, *Water shortage, *Crop production.

A dynamic programming model was presented which determined the time and quantity of irrigation which maximized the total net returns from a crop. The state variables for the model were the soil moisture content and quantity of water available in each of the subdivided time periods considered for the growing season. The decision variable was the quantity of water used in each period. It was assumed that a coefficient which is a function of the soil moisture could be found that would give the percent of maximum yield of the crop for each period. The objective was to maximize the product of these coefficients times the maximum yield. Constraints for the model were physical (e.g., (1) amount of water available at the beginning of the season, (2) wilting point and field capacity for the soil moisture). An inventory constraint provided continuity between periods for the soil moisture. It was concluded that the methodology described could permit good irrigation management, provided more information became available on the critical period characteristics of commercial crops. (Gysi-Cornell)

A SOCIALLY OPTIMUM PRICING POLICY FOR A PUBLIC WATER AGENCY,
Washington Univ., Seattle; California Univ., Berkeley.
Gardiner Brown, Jr., and C. B. McGuire.
Water Resources Res, Vol 3, No 1, pp 33-43, 1st Quart 1967. 5 tab, 12 ref.

Descriptors: *Linear programming, Aquifers, Computer models, *Conjunctive use, Discount rate, Water allocation (Policy), *Water distribution (Applied), Water demand, Fixed costs, Variable costs, *Economic efficiency, Estimated benefits, Marginal costs, Public benefits, Social values.
Identifiers: Kern County Water Agency (Calif), Demand function, Pumping tax, Lagrange multiplier.

A model was developed for determining the socially optimum price to charge irrigation districts for both surface and groundwater supplies. An algorithm was developed assuming linear demand functions, and steady-state conditions for groundwater levels and water demand functions. A divergence between social and private optimums arose from the existence of unadjudicated rights to groundwater supplies. The social optimum was achieved by a taxing policy which equated the farmers' marginal private costs to the true marginal social cost. Hence, the farmers' profit maximization motivation yielded the desired social optimum. An example of the model was given for the Kern County Water Agency (California). Water prices, tax rates, and optimum lift levels were estimated for seven irrigation districts within the jurisdiction of the agency. (Gysi-Cornell)
W69-01215

OPTIMAL RESOURCE USE OVER TIME WITH AN APPLICATION TO GROUND WATER,
California Univ., Davis, California.
Oscar R. Burt.
Manage Sci, Vol 11A, pp 80-93, Sept 1964. 10 ref, 2 append.

Descriptors: *Dynamic programming, Aquifers, *Economic efficiency, Pumping, *Groundwater mining, Marginal productivity, Marginal costs, Synthetic hydrology, Water balance, Water allocation (Policy), *Water management, Optimum development plans, Consumptive use.
Identifiers: Kings River (Calif).

The problem of optimally allocating over time a fixed or only partially renewable resource was solved using dynamic programming. First and second degree approximations to the functional equation were used to solve the problem. Differentiation of the functional equation with respect to the resource level and its periodic use in order to maximize the expected net output yielded approximate decision rules for resource use. These decision rules were a function of current supply and interest rate. The results were applied to ground water storage control and tested empirically, using data from a study on the Kings River area in California. The results compared favorably with a decision rule obtained by detailed numerical methods. Additions to the resource were treated as random variables with probability distributions reflecting the type of resource and its method of recovery. The decision rules in general specified, as expected, that production should be expanded until marginal net output equals marginal recovery costs. (Gysi-Cornell)
W69-01216

THE OPTIMUM ALLOCATION OF STREAM DISSOLVED OXYGEN,
Johns Hopkins Univ., Baltimore, Md.; Cornell Univ., Ithaca, N. Y.
Jon C. Liebman, and Walter R. Lynn.

Water Resources Res, Vol 2, No 3, pp 581-591, 3rd Quart 1966. 11 p, 5 fig, 5 tab, 11 ref.

Descriptors: Biochemical oxygen demand, Design criteria, Digital computers, *Dissolved oxygen, *Dynamic programming, Economic efficiency, Sewage effluents, Oxygen sag, *Sewage treatment, *Standards, Waste assimilative capacity, *Stream improvement, Water policy, Water quality control.
Identifiers: Willamette River (Oregon), Uniform treatment.

A discrete dynamic programming model was used to minimize the cost of providing waste treatment to meet specified dissolved oxygen concentration standards in a stream. The model was developed from the Streeter-Phelps equation which relates dissolved oxygen to waste loading. It was assumed that the saturation level varied linearly within a reach. Choosing discrete values for water quality at the top of the reach, the costs of obtaining various levels of dissolved oxygen in successive downstream sections were computed by the recursive calculations of dynamic programming. A simplified example of the model based on data from the Willamette River in Oregon was solved and the results presented in tabular form. Three runs were made, one which met required stream standards, a second with the standards lowered by 0.1 mg/1 in all sections, and a third in which all plants treated at the same rate. The total cost of equal treatment was substantially more than the minimum cost of meeting the stream standards. (Gysi-Cornell)
W69-01217

FORMAL MODELS IN THE DESIGN OF WATER RESOURCE SYSTEMS,
Harvard Univ., Cambridge, Mass.
Robert Dorfman.
Water Resources Res, Vol 1, No 3, pp 329-336, July-Sept 1965. 5 ref.

Descriptors: *Analytical techniques, *Digital computers, Design, Economic efficiency, Environmental engineering, Linear programming, *Mathematical models, Monte Carlo Method, Queuing theory, Water resources development, *Simulation analysis, Systems analysis, *Water resources.

The use of simulation and analytic models in the design of water resource systems was discussed. A brief history of the evolution of these methods beginning with The Harvard Water Resources Program was given. A comparison of simulation techniques, where temporal sequences of events are reproduced on electronic computers reducing the time scale from decades to minutes, was made to analytic techniques, where consequences are expressed as explicit mathematical functions of design variables. The simulation model leads to convenient estimates of the consequences of design decisions even in complicated circumstances, but are awkward when a wide range of these decisions has to be evaluated. On the other hand, analytic models cannot be applied to practical problems without drastically simplifying them. It was suggested that the two methods can be used in tandem, with analytic models delimiting the range within which simulation is required. (Gysi-Cornell)

WATER QUALITY IMPROVEMENT PROGRAMMING PROBLEMS,
Stanford Univ., and Stanford Research Institute, Stanford, Calif.
Matthew J. Sobel.
Water Resources Res, Vol 1, No 4, pp 477-487, 4th Quart 1965. 11 p, 12 ref, 1 append.

Descriptors: *Dissolved oxygen, *Standards, Estuaries, Public benefits, Indirect benefits, Direct benefits, *Linear programming, Mathematical models, Optimization, Project planning, Constraints, Social values, Sewage treatment, Diffusion, Waste dilution, *Waste water treatment, Water policy, *Water quality control, Water values.
Identifiers: Delaware Estuary, Delaware River Basin Commission, Mixed integer linear programming.

The nature of regional water quality systems was outlined and programming models for several water quality improvement problems were presented. A linear programming formulation of a static or one-shot improvement in water quality at minimum cost was contrasted with a traditional uniform treatment policy for programming improvements. The constraints for the linear programming formulation were used throughout the remainder of the paper. The traditional policy resulted in a mixed integer problem. The maximization of the ratio of benefits to costs of an improvement program were transformed to a linear programming problem. An expected value formulation of the minimum cost improvement problem under a stochastic environment was given, followed by the quadratic programming problem of minimizing the variance of an improvement program. An application of least-cost models to a water quality improvement program for the Delaware estuary was discussed. The mixed integer linear programming problem was detailed in an appendix. (Gysi-Cornell)
W69-01219

TEMPORAL ALLOCATION OF GROUNDWATER,
Missouri Univ., Columbia.
Oscar R. Burt.
Water Resources Res, Vol 3, No 1, pp 45-56, 1st Quart 1967. 3 fig, 1 tab, 5 ref, 1 append.

Descriptors: *Water management (Applied), Temporal distribution, Surface-ground water relationships, Aquifers, Consumptive use, Dynamic programming, *Economic efficiency, *Future planning (Projected), Pumping, *Groundwater recharge, *Groundwater mining, Marginal productivity.
Identifiers: Decision rule, Present value, San Joaquin Valley (Calif).

A relatively simple economic model for allocation of groundwater either to storage or to immediate pumping was developed. Equilibrium storage was first assumed (constant recharge equalling constant rate of use) and the economic consequences of altering various parameters in the model with respect to the effect on these equilibrium stocks and rates of use were found. The assumption of constant recharge was then relaxed and the concept of a conditional decision rule for stochastic groundwater recharge and the properties of the implied equilibrium were discussed. A hypothetical example was given using estimated pumping costs for the San Joaquin Valley. In its simplest form, the derived decision rule was to equate marginal net output with respect to rate of use to capitalized marginal net output with respect to water stocks. The appendix outlined a procedure for estimation of the value of groundwater stocks as a contingency against uncertain future supplies. (Gysi-Cornell)

HISTORY AND SIGNIFICANCE OF SIMULATION MODELS,
Oregon State Univ., Corvallis.
Louis N. Stone.
The Use of Simulation in Water Research, Semn WR 006.67, pp 1-15, Jan 1967. 9 ref.

Descriptors: *Simulation analysis, Computer models, Analog computers, Analog models, History, Model studies, Systems analysis.

A presentation of the use of models, with emphasis on simulation, was given. Simulation was defined. Models in general were classified and discussed. Classifications included deterministic, stochastic, predictive, normative, gaming, linear programming, and system models. Some historical classical models were described, including resistance, electric circuit, electrolytic tank, nonlinear resistor, and gravitational models. Several illustrative examples of simulation models were given. They included an atmosphere-soil boundary model, an underground water flow model, a flood simulation model, an acoustic ray model, a biochemical systems model, and a 'conditioned response' model. Three simulation programs, called PACTOLUS, MIDAS and DYNAMO, developed for use on digital computers, were mentioned. (Gysi-Cornell)

THE OPTIMIZATION OF SINGLE-PURPOSE RESERVOIR DESIGN WITH THE APPLICATION OF DYNAMIC PROGRAMMING TO SYNTHETIC HYDROLOGY SAMPLES,
California Univ., Los Angeles.
Warren A. Hall, and David T. Howell.
J Hydrol, Vol 1, pp 355-363, Dec 1963. 12 ref.

Descriptors: *Dynamic programming, *Synthetic hydrology, *Reservoir design, *Optimization, Consumptive use, Monte Carlo method, Monetary benefits, Return (Monetary), Correlation analysis, Risks, Water demand, Water policy, Simulation analysis, Hydrograph analysis.
Identifiers: Operating policy.

A method was developed for determining the optimal size of a single-purpose reservoir on a stream with serially correlated annual flows, in order to provide storage for consumptive use. The operating policy on an annual basis was obtained as a consequence of the analysis. The procedure combines dynamic programming sequenced over time, where each time interval could have a different return function, with a Monte Carlo technique using a number of equally likely sample sequences of inflow drawn randomly from a long synthetically generated period of record. The analysis gave an optimum operating policy, the expected value of the optimal return and the degree of risk involved which arises from the hydrologic characteristics of the stream. (Gysi-Cornell)
W69-01222

PLANNING RATIONAL WATER POLLUTION CONTROL POLICIES,
Cornell Univ., Ithaca, N. Y.
Daniel P. Loucks.
Proc Int Conf Water For Peace, Pap No P/39, Washington D C, May 1967. 8 ref.

Descriptors: *Water pollution control, *System analysis, Computer programs, Optimization, Economics, Operations research, *Planning, *Water policy, *Standards, Water quality control, Stream improvement, Stochastic processes, Risk, Evaluation, Probability.
Identifiers: Sensitivity analysis.

The use of systems analysis techniques in the planning and evaluation of water pollution control policies is discussed. Water pollution is defined and present methods for defining pollution control policies are described. The techniques of systems analysis and operations research, such as the mathematics of optimization, economic theory, probability theory and computer programming used for the establishment, improvement, and sensitivity analysis of stream quality standards and design criteria, are examined. The importance of sensitivity analysis in the establishment of rational policies is stressed. The need for basing policies on the minimization of risk of violating quality standards, because of the stochastic nature of stream flows, rather than on deterministic standards is discussed. Additional research areas are suggested. (Gysi-Cornell)

PRELIMINARY OPTIMIZATION OF AN AQUEDUCT ROUTE,
Calif. Univ., Los Angeles; The National Cash Register Co., Hawthorne, Calif.
Warren A. Hall, and John S. Hammond, III.
Amer Soc Civil Eng Proc, Vol 91, No IR1, pp 45-67, Mar 1965. 23 p, 13 fig, 19 ref, 2 append.

Descriptors: *Dynamic programming, *Aqueducts, Terrain analysis, Network design, Water conveyance, Construction costs, Electrical power costs, Fixed costs, Variable costs, Hydraulic gradient, *Economic efficiency, Optimum development plans, Engineers estimates, Surfaces, Marginal benefits.
Identifiers: Lift and reach, Least cost routes, Network analysis.

The preliminary routing of an aqueduct was structured as a network problem. Dynamic programming was used to choose the most economical route from a variety of potential routes. The general problem was divided into three subproblems: (1) the subdivision of the general route area into polyhedron surfaces in order to locate the nodes of the network, (2) lift and reach cost calculations in order to find the minimum link costs, and (3) finally determining the most economic routes connecting any two points in the network. The first two subproblems were discussed in greater detail than the third. Several references were suggested for further study on finding the most economic routes through a network. The optimal path across a plane was shown to be one 'lift' and one or at most two 'reaches.' A numerical example using hypothetical data was presented. Some extensions of the model were proposed for further investigation. (Gysi-Cornell)

PROBLEMS IN DEVISING PROCEDURES FOR APPROXIMATING OPTIMUM SYSTEMS.

pp 86-95 of Entry No. W69-01269 in 05G.

Descriptors: Water pollution, Pollution abatement, *Water pollution control, Cost analysis, Economics, *Model studies, *Optimization, Regional analysis, Systems analysis, Approximation method, *Optimum development plans, Computer programs, Simulation analysis, Input-output analysis, Sequence, Timing, Operations research, Computer models, Project planning, Cost comparisons.

Problems in devising procedures for approximating optimum systems are discussed. Possible alternatives are discussed with respect to a cost minimization objective. Possible use of simulation and programming as aids in planning are noted. Abatement measures and related costs are viewed as inputs and reduction of pollution as the output. The problems of timing and sequence are viewed. It is concluded that the application of operations research techniques merits attention; however, the complexity of such analysis is noted.

Descriptors: *Hydraulic models, *Runoff, *Surface runoff, Mathematical analysis, *Watersheds, Drainage basins, Subsurface drains, Hydrographs, Runoff forecasting, Hydrology, Rainfall, Bibliographies, Atmospheric precipitation, Ditches.
Identifiers: *Hydrologic models, Iowa, *Potholes, *Depression storage, Mathematical models, Subsurface drainage, Runoff hydrographs.

Hydraulics of runoff from depressional areas in north-central Iowa were studied. Definable relationships existed among the geometrical properties of depressions; the frequency distribution of depressional areas can be approximated by a Weibull probability density function. From synthesized mathematical model watersheds, an area of a few square miles had depressions storing more than 1/2 in. of surface runoff. Another mathematical model was developed, capable of simulating runoff hydraulics appearing in drainage ditches less than 48 hr after rainfall. The model had several components, each based on a rational analysis of the process that the component represents. This is a valid method for studying runoff from depressional areas and for investigating the effect of subsurface drainage on peak flows. The effect of changing the values of several variables on runoff hydrographs was investigated. Resulting changes in the hydrographs were on a qualitative basis from a rational analysis of the problem. This indicates that the components of the model represent their respective individual counterparts of the runoff cycle, rather than combining to give a hydrograph that best fits observed data. (USBR)

THE ECONOMICS OF CONJUNCTIVE USE OF GROUND AND SURFACE WATER,
California Univ., Davis.
Oscar R. Burt.
Hilgardia, Vol 36, No 2, pp 31-111, Dec 1964. 81 p, 2 fig, 49 tab, 56 ref, 4 append.

Descriptors: *Conjunctive use, *Dynamic programming, *Linear programming, *Economic efficiency, *Water management, Aquifers, Markov processes, Distribution patterns, Discount rate, Marginal productivity, Water balance, Groundwater recharge, Hydrologic data, Surface-groundwater relationships.
Identifiers: Kings River (Calif), Pine Flat Reservoir (Calif), Present value.

The economics of water resources was discussed with special emphasis on the optimal management of water in existing storage and distribution facilities. Dynamic programming was used to determine the optimal conjunctive use of single and multiple storage facilities. An alternative, requiring only a small computer and simple program, but confident prediction of streamflows, was given. Linear programming was used to estimate the net social benefits and the net output function. A detailed description was given of activity demand functions and the environmental constraints. Surface water policy and the probability distribution and transition probabilities for ground water storage were discussed. Numerical examples were presented with data obtained from a study of the Kings River, Pine Flat Reservoir, California. The empirical results considered present, marginal, and expected values of management policies and the Markovian properties of stochastic hydrology. (Gysi-Cornell)

FEDERAL RESEARCH AND DEVELOPMENT PROGRAMS: DECISION MAKING PROCESS CONVERSION OF DEFENSE RESOURCES WITH EMPHASIS ON EXPANDED PROGRAMS OF URBAN DEVELOPMENT, MASS TRANSPORTATION, AND WATER RESOURCE DEVELOPMENT.
Cornell Univ., Ithaca, N. Y.

Hearings, House Comm on Government Operations, Subcomm on Research and Technical Programs, 89th Cong, 2nd Sess, pp 177-212, 1966. 36 p, 3 append. OWRR Project A-005-NY.

Descriptors: *Diversification, *Water development, Water resources, *Transportation, *Urban renewal, Area development, Questionnaires, Community development, *Industries.
Identifiers: *Defense industries, Cornell U (NY).

This is a report of a study carried out at the School of Industrial and Labor Relations at Cornell University. The research involved collecting facts, investigating attitudes, and analyzing the interactions of groups of people as they attempted to deal with a common problem. Specifically, the purpose was: (1) to determine the extent to which some leading defense contractors are trying to diversify, thereby reducing their dependence on defense business; (2) to identify major obstacles standing in the way of business firms converting some of their resources from defense to nondefense activities; (3) to explore the interest of defense companies in entering the market for expanded programs of water resource development, mass transportation, and urban development; and (4) to examine the potentiality of greater industry and government cooperation in expanded programs of water resources development, mass transportation, and urban development.

WATER RESOURCES RESEARCH AND EDUCATIONAL NEEDS IN MINNESOTA.
Minnesota University, Minneapolis.

Water Resour Res Center Bull 5, Univ Minnesota, Mar 1967. 120 p, 43 fig, 18 tab, 48 ref. OWRR Project A-999-Minn.

Descriptors: *Water resources development, *Resource development, Water pollution, Water supply, Water resources, Recreation, *Education, Water law, Economics, Priorities, Natural resources, Planning, Water quality, Water pollution control, Floods, Minnesota, Economic impact, *Research and development.
Identifiers: Water budget, Water level, Water resources management.

This bulletin is a collection of papers presented at a Conference on Water Resources Research Needs in Minnesota held on November 15-16, 1966 in St. Paul. Results of a questionnaire concerning research need priorities are summarized. Subjects covered in these papers are research needs, water supply, water pollution, floods, land and water, water-based recreation, economic aspects and education in water resources.

conservation, Water quality, Water utilization, River basin development, Cooperation, Water rights, Policy matters, Weather modification, Feasibility studies, Evaluation, Economics, Benefits, Water harvesting, *Water management (Applied).
Identifiers: Water shortages, Western United States.

Few if any issues are more crucial for the future development of Western states than effective use and management of the region's water resources. Unprecedented population and economic growth during the post war period has resulted in unanticipated water needs and demands. Every state in the West is presently faced with dangerously declining groundwater tables, serious stream pollution, socially disrupting conflicts among water users, and in some communities, critical shortages. Western water development involves many disciplines and facets of knowledge. The range of subject matter is reflected by the contributors to this volume who come from many fields of training and specialization, including the research, policy-making and managerial phases of water use. Their combined talents notwithstanding, the contributors would not claim that their collective papers cover all aspects of this topic. This work is viewed as an introduction for the citizen to a complex field of public and private decision-making.

CRITERIA FOR EVALUATING THE QUALITY OF WATER BASED RECREATION FACILITIES,
North Carolina University, Chapel Hill.
Charles Stott.
Water Resour Res Inst, Univ N Car, Rep 1, 1967. 88 p, 36 photo, 55 ref, 3 append. OWRR Project A-011-NC.

Descriptors: Bibliographies, *Recreation facilities, Recreation, Swimming, Boating, Water sports, Locations, *Evaluation, Design, Field tests, Construction, Maintenance, Safety.
Identifiers: Parking facilities, *Criteria, Selection, Quality levels.

This study is limited to establishing criteria for day use facilities, roads, parking areas, picnic areas, swimming areas and boating areas. The criteria for each of these facilities is further divided into site selection, design, and construction, and state of maintenance and appearance. Many factors affecting quality were listed, checked with professional practitioners, and refined many times, then changed into criteria in the form of questions, followed by an interpretations. The criteria were pretested, refined and tested again in the field. The rating scale for evaluation criteria is given.

ECONOMICS IN INTERDISCIPLINARY WATER RESOURCES ANALYSIS,
Rutgers--The State University, N J.
William Whipple, Jr.
Pap, Amer Water Resour Ass, San Francisco, Calif, Nov 1967. 14 p, 13 ref. OWRR Project A-014-NJ.

Descriptors: *Economics, *Water resources, Analysis, Planning, Taxes, Project planning, Multiple purpose projects, *Optimum development plans, Flood control, Social values, Hydroelectric power, Pollution abatement.

The report outlines some central issues of water resources planning and policy that require economic solutions. The author feels that the economist should assume the key role, although others should assist him in defining the problem and supplying certain parameters. He recommends econometrics and the interdisciplinary approach.

ECONOMIC EFFICIENCY, SOCIAL POLICY, AND THE POLLUTION PROBLEM.

pp 18-28 of Entry No. W69-01269 in 05G.

Descriptors: Impaired water quality, Water pollution, *Water pollution effects, Comparative costs, Economic efficiency, Economic evaluation, *Economic impact, Economics, Efficiencies, Indirect costs, Public benefits, *Welfare (Economics), Political aspects, *Social aspects, Social impact, Social values, Model studies, Public health, Social needs, Benefits.

The ways in which unregulated market results with respect to water pollution fail to coincide with the requirements of an ideally functioning market system are discussed. Some of the directions that appropriate public policy might take are illustrated through the use of a hypothetical basin-wide firm, which recognizes that pollution causes technological links between various activities. It is pointed out that interdependency in consumption and conditions of supply do not yield appropriate social valuations in regard to some aspects of water quality. Political valuations become significant in these instances. It is concluded that none of these considerations negate the rationale of a competitive market system, but rather grow out of such a system.
W69-01271

EVALUATION-DETERMINATION AND INTEGRATION OF INDIVIDUAL AND SOCIAL VALUES--FOCUS OF PUBLIC POLICY.
pp 29-45 of Entry No. W69-01269 in 05G.

Descriptors: *Design flow, Political aspects, *Public benefits, Social aspects, *Social values, Water policy, *Water pollution control, Water resources development, Public health, Pollution abatement, Water pollution, Water pollution effects, Governments, River basin development, Optimum development plans, Specialization, Economic impact.

The social objective of waste water disposal policy and the role of public policy in pollution abatement are considered. Stream specialization techniques are discussed with emphasis on the advantages of specialization and methods of evaluation. The design flow, a general problem in evaluation is discussed in detail. It is concluded that government intervention into the area of disposal of wastes into water bodies cannot only improve efficiency measured in terms of market values, but can and should take explicit cognizance of extra-market values and considerations. It is noted that system planning would ideally consider all alternative uses, but that the inherent complexity of the problem along with conceptual and informational deficiencies make optimum solutions virtually unattainable. A recommended approach is to set out basin-wide pollution control problems in formal terms. It is concluded that considerable research into various areas is essential. Benefit-cost analysis and property values are discussed in appendices.

AN ACT TO CREATE THE SOUTH CAROLINA WATER RESOURCES PLANNING AND COORDINATING COMMITTEE, AND TO PROVIDE FOR ITS DUTIES AND RESPONSIBILITIES.
South Carolina Laws no 61 (1967).

Descriptors: *South Carolina, Legislation, *Administrative agencies, *Water resources development, Water supply, Water quality, Water pollution, Political aspects, Navigation, *Long-term planning.
Identifiers: Water agencies.

The South Carolina Water Resources Committee is created. It is to have eighteen members and their method of appointment and terms are provided. An executive director and staff are to be hired. The committee is to advise the governor and general assembly in: (1) establishing a coordinated and comprehensive state water resources policy; (2) coping with special rural and urban water problems; (3) coordinating state agencies; (4) participating in federal programs; (5) protecting the interests of all groups in representation on interstate water agencies; (6) recommending law revision; and other functions as may be designated by the governor and general assembly. The committee is authorized to carry on studies, hold hearings and to contract with any agency. In connection with its recommendations, the committee is directed to consult with other state agencies, federal, state and local governments, and appoint advisory boards. Considerations such as adequate water supply, water quality, navigation, and watershed management, are to be taken into account by the Committee. (R. F. Williams-Fla)

Allen V. Kneese, and Blair T. Bower.
In Managing Water Quality: Economics, Technology, Institution, Baltimore: Johns Hopkins Press 1968, Chap. 5, p 75-96, 2 fig, 18 ref.

Descriptors: *Legal aspects, Optimum development plans, Waste discharge, Water quality, *Market value, *Economic justification, Project planning, Costs, Economies of scale, *Water quality management, Judicial decision, Social values, Regional analysis, Regional development, Decision making, Institutional constraints.
Identifiers: Technological external diseconomies, Externalities, Decentralized decision making.

To realize the advantages of decentralized dec sion-making mechanisms ways must be found t optimally control external effects and direct inte dependencies. Technological external diseconomies are illustrated by such problems as air pollution and water pollution. The failure of municip and industrial waste dischargers to consider th subsequent water uses may be made more expe sive or foreclosed entirely by their discharge, is pe haps the basic element of the water quali problem. Examples of how an optimal situation c be achieved through the market is presented. F each level of waste withheld from discharge there an optimum combination of waste withholdi measure which is in turn associated with a certa cost. Although it is possible for market transactio to take externalities into account under certain c cumstances, transactions of this kind are rarely ganized. The damaging effects of waste dischar are diffuse and the linkages between parties co plex, so that establishing a market which wo systematically take account of external costs wo be a complex and expensive procedure. Efforts use litigation to balance costs and returns suf from the same disabilities as market transactio Six deficiencies of legal remedies are discuss Four suggestions for properly structuring the diciary to play a useful and essential supplement role are given. A detailed discussion of the po bility of internalizing the externalities of prod

tion through a basin-wide firm are presented. (Gargola-Chicago)

THE GALVESTON WORK PLAN,
Department of the Interior, Federal Water Pollution Control Administration, and Texas Water Pollution Control Board.
Dan M. Wells, Ernest T. Smerdon, and Earnest F. Gloyna.
Texas Technological College, Texas A and M University, and the University of Texas, 1966, 10 p, 4 fig, 11 append.

Descriptors: Water resource development, *Project planning, *Optimum development plans, Water quality, Economic evaluation, Public benefits, Land use, Municipal water supply, Waste water treatment, Water law, Sedimentation, Phytoplankton, Administrative decisions, Institutional constraints, Models, Financing.
Identifiers: Galveston Bay, Texas, Recreation benefits.

The work plan was designed to develop a comprehensive study of the Galveston Bay area which would provide a sound water quality management plan. The work proposed is divided into four functional categories of projects. The first functional category is concerned with the evaluation of costs of making incremental improvements in water quality for both present and future conditions and for a variety of treatment programs. The second category attempts to evaluate the social benefits associated with improvements in water quality. The evaluation of the benefits to marine life associated with incremental improvements in water quality is the third functional category. The fourth category uses results obtained in the first three along with legal research and mathematical modeling techniques to determine the optimum feasible water quality management program. Estimates of the budget are presented and the necessary organizational structure outlined. The organization would include a (1) policy making group, (2) project manager, (3) technical advisory group, (4) specialist in budget control and contracting, (5) specialists in water quality management, marine biology and ecology, land use planning, economics, and recreation, and optimization and computer applications, and (5) task forces for coordinated attack on problems. A schedule detailing the expected progress through time of the organization is put forth. (Gargola-Chicago)

ECONOMIC DERIVATION OF RESERVOIR OPERATING RULES,
Kentucky Univ, Lexington, Civil Eng Dept.
L. Douglas James.
ASCE Proc, J of Hydraulics, Vol 94, No HY5, Pap 6111, pp 1217-1230, Sept 1968. 14 p, 4 fig, 7 tab, 10 ref.

Descriptors: *Flood control, Multiple-purpose reservoirs, Optimum development plans, *Recreation, *Reservoir operation, *Water supply, Water law, Water transfer, Simulation analysis.
Identifiers: *Economic simulation models, Rough River Reservoir.

Rules prescribing the amount of water which should be kept in a reservoir on a month by month basis throughout the year are needed to maximize benefits from operation of existing reservoirs or from operation of reservoirs being considered in system planning. Economic tradeoffs were used to resolve the conflicting storage requirements of flood control, recreation, and water supply in accordance with monthly demand patterns. Total potential benefits and economic loss functions for each of the three purposes were derived and used to derive a set of curves for determining optimum storage in Rough River Reservoir, Kentucky, for each month of the year. Practical and legal problems expected in implementing such rules are discussed. (Author)

OPTIMISATION IN THE USE OF THE MEANS OF PRODUCTION AND TRANSMISSION,
M. Adnet, P. Auges, and M. Dupoux.
Int Conf Large High Tension Elec Syst, Paris, France, June 1968. Pap 32-15, 34 p, 8 fig, 2 ref, 4 append.

Descriptors: *Electric power production, Optimum use, Economics, Water utilization, *Transmission (Electrical), Calculations, Models, Reservoir operation, *Power system operations, Hydroelectric power, Thermal power, Foreign countries, Operations, Mathematical analysis, Irrigation, Water requirements.
Identifiers: France, Interconnected systems, Energy budget, Energy transfer.

Objectives and methods used by Electricite de France in operating its complex system of thermal and hydroelectric powerplants to assure uninterrupted electrical energy to that country are described. Problems involved in obtaining maximum utilization of the equipment, overall powerplants, existing transmission network, and fuel reserves are considered. Managing hydraulic reservoirs for most effective use is discussed. Coordination of powerplants within the same valley must be considered for the best economic management of water supplies derived from drainage areas. Daily programs of starting and stopping generating units are important for economic system operation. The influence of system calculation must be considered for economic control of production and consumption. The essential task is to ensure the supply to consumers under correct conditions of frequency and voltage, while managing production of electric energy in the most economic manner. (USBR)

OPTIMUM PENSTOCK DIAMETER FOR HYDROELECTRIC POWERPLANTS AND PUMPING PLANTS,
California State Department of Water Resources, Sacramento.
Ravinder K. Jain, and A. R. Griffith.
Tech Memo No 34, Dept Water Resour, State Calif, June 1968. 25 p, 2 fig, 2 tab, 9 ref, append.

Descriptors: *Penstocks, *Hydroelectric powerplants, *Pumping plants, Economics, *Optimum design, Head losses, Cost comparisons, Steel plates, Computer programming, Mechanical engineering, Stress analysis, Friction, Excavation, Backfills, Protective coatings, Manning formula, Planning, Costs, Construction costs, Steel pipes.
Identifiers: Tehachapi Pump Plant (Calif), *Computer programs, Annual costs, *Computer-aided design, California, California State Water Proj.

An economical method is outlined for determining the optimum penstock diameter for hydroelectric powerplants and pumping plants, based on a minimum total annual cost. This total annual cost includes all costs of construction and the cost of power loss due to friction. All such factors are brought explicitly into the cost analysis utilizing a computer program. Laborious calculations are avoided and the relationships existing between the various cost aspects may be studied in greater detail because of the basic simplicity of this approach. Total computer cost is approximately $1.50 for 2 sets of data. This method was developed while designing the Tehachapi Pumping Plant Discharge Lines. The computer input and output, example cases, and program listings are given. (USBR)

BULGARIA'S HYDRO-POWER POTENTIAL,
Liubomir S. Yordanov.
Water Power, Vol 20, No 9, pp 368-375, Sept 1968. 8 p, 6 fig.

Descriptors: *Hydroelectric powerplants, Rainfall, Runoff, Underground powerplants, *River basin development, Pumped storage, Project planning, Snowmelt, Multiple purpose projects, Municipal water, Irrigation, Dams, Industrial water, Reservoirs, Pressure tunnels, Electric power, Geology, Foreign projects.
Identifiers: Bulgaria, *Hydroelectric resources, Water use, Watershed management, Europe, *River cascade systems.

Hydroelectric and pumped storage plants in service, under construction, or proposed in Bulgaria are described. Geomorphological, climatic, hydrological, soil, and biogeographical characteristics of the region are discussed. Data are given for each existing hydroelectric installation. River cascade systems under construction are described. In addition to the principal cascades, there are 58 reservoir sites with dams exceeding 15 m high, and 65 hydroelectric powerplants under construction. Potential developments planned for the next 10 to 12 yr are listed. Problems that must be considered in Bulgaria's hydroelectric power development include: insufficient rainfall; dry climate; and the inadequate system of natural river courses, rockfalls, vertical cliffs, and avalanches. Pumped storage is considered as a solution to these problems. One small experimental pumped storage plant exists, but others are under construction or planned. Bulgaria's power generating potential characterizes the general economic growth. Power output has increased from 45 kwh per capita in 1944 to 1400 kwh in 1966, and is expected to reach 2500 kwh in 1970 and 4500 kwh in 1975, the highest in the Balkans. (USBR)

SURVEY CONTROL FOR CONCRETE DAM CONSTRUCTION,
Bureau of Reclamation, Montrose, Colo.
Maynard J. Willis.
Proc Amer Soc Civ Eng, J Surv Mapp Div, Vol 94, No SU2, pp 169-188, Sept 1968. 20 p, 11 fig, 1 tab, 3 ref, append.

Descriptors: *Surveying, Surveying instruments, Concrete dams, *First order surveys, Construction, Second order surveys, Offsets, Bench marks, Monuments, Plane surveying, Theodolites, Triangulation nets, Arch dams.
Identifiers: *Surveys, *Morrow Point Dam (Colo.), Construction control, Construction practices.

Precision survey controls for Morrow Point Dam, a double-curvature, concrete-arch structure, 465 ft high, were required through reconnaissance, site investigation, and preconstruction phases to satisfy specific needs of the designers, and to accommodate the rough terrain. Surveys for this type of project can be grouped into 2 convenient classifications; control and construction. Control surveys are directly related to geodetic principles. Construction surveys are used under localized application of plane surveying for structure layouts. Horizontal control surveys for Morrow Point Dam consisted of a triangulation grid based on the state coordinate system. Vertical control was elevation in feet above mean sea level, datum of 1929. After completing excavation for the access roads, a primary triangulation network was established with stations located adjacent to the powerplant open-cut area and the keyways for the dam. The method used in adjusting the triangulation scheme is presented. A series of bench marks was established from a line of first-order leveling by the U S Coast and Geodetic Survey, and extended the leveling to the vicinity of the primary features of the project. An electronic computer processed repetitious surveying calculations. (USBR)

WATER IMPORT SYSTEMS FOR ARID LAND DEVELOPMENT.
Ralph M. Parsons Co., Los Angeles, Calif.

International Symposium About Increasing of Food Production in Arid Lands, Instituto Tecnologico de Estudios Superiores Monterrey, Monterrey, Nuevo Leon, Mexico, April 22-25, 1968. 16 p, 3 map, 2 tab.

Descriptors: *Arid lands, *Water resources development, *Geographical regions, *Climatology, Mexico, *Reservoir storage, Water transfer, Economic feasibility, Rivers, Canals, Tunnels, Water shortage, Hydroelectric power, Natural resources.
Identifiers: *North America Water and Power Alliance, Canada, American Desert.

The North American Water and Power Alliance is thoroughly discussed in this article. The NAWAPA concept utilizes geographical and climatological features of the North American Continent to collect and store excess water of northwestern areas of the continent and distribute it to arid areas of Canada, the United States and northern Mexico. The concept envisions water deliveries from these surplus areas in times of drought into the American Desert about 9 years after initiation. The NAWAPA is economically feasible and financially within the existing money markets. (Blecker-Ariz)

THE MARKET FOR WATER BASED OUTDOOR RECREATION SERVICES IN NEW CASTLE COUNTY, DELAWARE,
Delaware Univ, Newark.
Paul Seidenstat.
Univ Delaware Water Resources Center Contrib No 2, July 1966. 66 p, 5 fig, 18 tab, 55 ref, append. OWRR Project A-003-Del.

Descriptors: *Marketing, *Recreation, Recreational facilities, Water resources, Outdoors, Boats, Fish, Swimming, Public services, Statistics, Bibliographies, Delaware.
Identifiers: New Castle County (Delaware), Water use.

Under a grant for the Water Resources Center of the University of Delaware acting under the Federal Government's Water Resources Research Act of 1965, an investigation of the allocation and development of the water related recreation market in New Castle County, Delaware, was undertaken. In the process of this research activity, the author found it helpful to develop a framework for the analysis, pulling together much of the literature in this field. What has emerged, we hope, is more than just a study of water resource development in one county but a framework to facilitate rational choice-making at the local governmental level everywhere.

WATER AND SEWER BOND SALES IN THE UNITED STATES, JANUARY - DECEMBER 1966.
Federal Water Pollution Control Administration, Washington, D C.

FWPCA Grant WP-00016, Fed Water Pollut Contr Admin, Div Pollut Surveillance, Jan-Dec 1966. 10 p, 14 tab.

Descriptors: *Sewers, *Construction costs, Costs, *Financing, Interest rate, Interest, Investment.

This annual report of Water and Sewer Bond Sales in the United States contains data which are basic and necessary to the orderly and efficient management of water supply and pollution control programs. It reflects, in a measure, the extent of financing to fulfill these two important public services. The report also provides a ready source of economic reference for financial, investment and banking interests; for the building and contracting trades and professions; and for authorities responsible for providing public water supplies and sewerage systems. The publication series, over the years, is a good indicator of interest rate and construction cost trends in these two types of public utility. Data are presented in three categories according to the use of the proceeds from the sale: (1) Water, when the bonds have been sold to finance water facilities; (2) Sewer, to finance sewage facilities; and (3) Combination, to finance jointly water and sewage facilities where the portions attributable to each type are not designated. Data describing bonds sold to finance other types of construction in combination with water and/or sewage facilities construction are excluded. Data describing bonds sold to finance storm sewers are omitted, although these data are available. (Author)

IMPACT AND INCIDENCE OF TAXATION ON WATER UTILITIES IN RHODE ISLAND,
Rhode Island University, Kingston.
Marvin Pitterman.
Univ Rhode Island Completion Rep A-005-RI, June 1966. 23 p, 8 tab, 15 ref. OWRR Project A-005-RI.

Descriptors: Bibliographies, *Public utilities, *Taxes, Analytical techniques, *Rhode Island, Analysis, Income, Investment, *Water supply, Economic impact, Population, Community development, Economics.
Identifiers: Economic evaluation.

This paper is a study of effect of taxation on water utilities in Rhode Island. It involves a detailed study of 6 private or quasi-municipal water utilities in Rhode Island with great disparity in size. The method of descriptive research was used to develop and solve problems by obtaining and interpreting necessary information and data. Facts used in this approach were obtained principally from Rhode Island Utilities Commission, annual reports of the 6 utilities, articles in daily newspapers, and interviews with local water authorities. Important conclusions reached were: (1) taxes do not detract from private or quasi-municipal water utilities development; (2) utility taxation does not lessen quality of service to the consuming public; (3) the private or quasi-minicipal water utility bears the impact of utility taxation; (4) the incidence of utility taxation is borne by the consuming public; (5) rate increases must be slightly higher due to utility taxation; (6) the Utility Commission protects the consumer from unwarranted rate increases and (7) the utility taxation does not prevent water utilities from servicing expanding areas.

VILLAGE OF ALBANY V GREATER LIVINGSTON WATERWORKS CO)TRANSFER OF WATERWORKS FRANCHISE(.

193 So 2d 110-114 (Ct App La 1966).

Descriptors: *Louisiana, *Water works, Water rates, Utilities, Legal aspects, Judicial decisions, Local governments, Contracts.
Identifiers: Franchises.

Village of Albany seeks to have franchise holder's transfer of waterworks franchise to water company declared invalid. The Louisiana Court of Appeals held that referendum approval of a franchise grant was not required where tax dollars were not being used in the construction and operation of the franchise system. Even if approval of the mayor and aldermen were necessary before a franchise could be transferred by its holder to another, such approval had already been given in the present case by the grant of the franchise to the holder, 'his heirs, successors, or assigns.' Language of a statute that provided that a municipality 'may' authorize or assent to all transfers of franchises by the grantee and its successors, and assigns was permissive in nature. A municipal corporation may regulate rates on a system it owns or leases, but in nearly all other cases the Louisiana Public Service Commission regulates rates of privately owned utilities. (P. N. Smith-Fla)

6D. Water Demand

HACKENSACK WATER CO V BOROUGH OF UPPER SADDLE RIVER)ADMINISTRATIVE STANDARDS FOR WATER DIVERSION(.

88 N J Super 362, 212 A 2d 394-402 (1965).

Descriptors: *New Jersey, Administrative agencies, *Administrative decisions, *Diversion, Diversion losses, Judicial decisions, Legislation, *Water law, Water permits.
Identifiers: Minimum flow.

The case involved an appeal by a New Jersey borough and village from a determination of the Water Policy and Supply Council granting an application by Hackensack Water Company for approval of a diversion of water from the Saddle River by two wells. According to New Jersey law in order to merit the Council's approval proposed plans for water diversion must: (1) be justified by public necessity; (2) provide for proper and safe construction of facilities; (3) provide for the prevention of contamination; (4) insure that any resulting reduction in the dryflow of a stream will not produce unsanitary conditions or otherwise injure public or private interests; and (5) be just and equitable to municipalities and their inhabitants with regard to present and future water needs. The court held that since the Council's decision did not so depart from the record evidence as to become arbitrary, capricious or unreasonable, it would not be set aside. The court noted that if conditions changed or if something was overlooked, the Council's decision was subject to review at any time in the public interest. Administrative law arguments were also discussed. (Patterson-Fla)

Identifiers: *Photointerpretation, *Remote sensing, Images, Aerial reconnaissance, Environmental effects, Environmental engineering.

The need for environmental analysis is apparent when the world population explosion problem is considered. The environment that must satisfy the needs and desires of the expanding population is not inexhaustible; its components are so inter-

lated that a beneficial utilization of one can result in an unintended but detrimental influence on another. The increase in population may someday exceed our ability to house and feed people on a worldwide basis. Water demands rise with population increase and per capita requirements. The problems of waste disposal and pollution resulting from these increases are discussed. Remote sensing techniques could be a great aid to man as he studies his environment. Techniques and applications of photography, thermal sensing, radar, and acoustical sensors are discussed. An example demonstrates the amount and type of information that can be obtained from a detailed stereoscopic study of aerial photography. (USBR)

6E. Water Law and Institutions

WATER RESOURCES ADMINISTRATION IN DELAWARE,
Delaware University, Newark.
Roger Smith Hoeh.
Univ Del Water Resour Center Contrib No 1, Aug 1966. 175 p, 3 fig, 1 map, 122 ref. OWRR Project A-003-Del.

Descriptors: *Water resources, Water management, *Water resources development, Water sources, Governments, Interstate compacts, Surface waters, Water conservation, Water pollution, Groundwater, *Delaware, Legal aspects.
Identifiers: Delaware River Basin, *Water resources management.

The structure and functions of Delaware governmental agencies concerned with water resources are discussed. Future legal problems associated with water resources are apt to be concerned with the state's basic need: (1) to clearly define the scope of water rights; (2) to provide some mechanism for implementing and enforcing a water resources plan; and (3) to create a central advisory, information and policy coordinating center at the state level. Administratively, planning and development activities are conducted by separate agencies directly responsible to the Governor, while the other agencies are considered to be legally and formally autonomous. Delaware agency administrators depend to a considerable degree on informal agreements with their counterparts in other states. These agreements may attain a degree of permanence comparable to a formal, written agreement as the practice continues over an extended period.

PROBLEMS ARISING OUT OF MONTANA'S LAW OF WATER RIGHTS,
Albert W. Stone.
OWRR Project A-002-Mont, Mont Law Rev, Vol 27, pp 1-18, 1965. 18 p.

Descriptors: *Water law, *Montana, *Water rights, Legal aspects, *Prior appropriation, Beneficial use, Adjudication procedure, Permits, Legislation, Administration, Water resources development.

Montana is limited in developing water resources by laws and administrative patterns which were formed before Montana became a state. It still recognizes 'use' rights--appropriations acquired without posting, filing, declaring or stating anything. This results in an indeterminate right, which must ultimately be established by future litigation, when the facts are most difficult to establish. In the meantime other developments are inhibited. The optional 'statutory method' of appropriation provides for local filing prior to commencement of works, and results in no record of the quantity of water actually appropriated upon completion, nor even whether any appropriation was completed. On adjudicated streams a court proceeding is required for appropriation. Although water rights may be transferred, the transferor can transfer no better right than he had, and hence the transferee cannot use water in an amount or manner which is more burdensome. The transferee is limited to that which would have been the needs of his transferor. There is a need to turn to a completely administrative system for ascertaining existing rights, permitting future appropriations which are consistent with the public interest, and administering water distribution. UNCERTAINTY IN WASHINGTON WATER RIGHTS,
Washington University, Seattle.
William Van Ness.
Water Resour Res Center, State Washington, Completion Rep, Feb 1967. 38 p, 4 append. OWRR Project A-002-Wash.

Descriptors: *Public rights, Reparian rights, Water allocation (Policy), Water rights, Water law, Water permits, Decision making, *Adjudication procedure, *Judicial decisions, Prior appropriation, Legislation.

The purpose of this paper is to objectively determine, insofar as presently available data allows, the present extent to which the central recording system for water rights and the procedures for making water rights a matter of record are sources of general uncertainty and title insecurity problems in the state of Washington. The primary analytical method chosen has been a detailed study of the decrees rendered in the fifty-eight statutory stream bed adjudications which have to date been conducted in this state. A secondary approach has involved a consideration of the Washington statutes and case law on water rights in an attempt to determine what role they play in eliminating or compounding title insecurity and problems of uncertainty now found in Washington water law. Because of the substantial similarity in the water law of the western states which follow the appropriation doctrine it is believed that the results of this study are indicative of problems-latent and apparent- in other states. HANDBOOK OF BASIC WATER LAW,
Louisiana State Univ., Baton Rouge.
George W. Hardy, III.
La Water Resour Res Inst, Bull 1, June 1966. 77 p. OWRR Project A-001-La.

Descriptors: *Civil law, *Water rights, Legislation, *Water law, State jurisdiction, Administrative agencies, Appropriation, Eminent domain, Withdrawal, Water conservation, Water pollution, Irrigation, Louisiana, *Water districts.
Identifiers: Baton Rouge Area (La).

The materials compiled in this bulletin are intended to form a basic handbook for the further study of possible solutions to the legal problems encountered in the study of salt water intrusion into aquifers utilized as a source of fresh water in East Baton Rouge Parish and the surrounding area. The bulletin consists of 3 parts: (1) a memorandum by Dean Frank Trelease of the University of Wyoming College of Law exploring problems of water conservation on a broad scale; (2) collected memoranda summarizing the law of several states other than Louisiana which have faced problems of water use and conservation; and (3) a compilation of relevant statutes and court decisions regarding water law, water use and control, and water conservation in Louisiana. This material will furnish a basis for more specific study and planning when sufficient geological, economic, and engineering data have been procured to permit the conception and presentation of plans for legal action to assure a steady supply of fresh water for industrial and domestic use.

DUVAL V THOMAS)RIGHT TO USE OF ENTIRE NONNAVIGABLE LAKE BY OWNER OF A PORTION OF THE LAKE(.
State of Florida, Tallahassee.

114 So 2d 791-795 (Fla 1959).

Descriptors: *Florida, Judicial decisions, Lakes, *Reasonable use, Barriers, Limiting factors, Access routes, Nonnavigable waters, *Boundaries (Property), Legal aspects, *Tourism.

Petitioners owned land on either side of respondant. Each constructed a barrier extending into a landlocked, nonnavigable lake to a corner common to all the parties, the result being to block respondant's access to the rest of the lake. Respondant brought an action to have the barriers removed, which was granted. The Supreme Court granted certiorari based on a possible conflict between common law and civil law rules. Petitioners urged the common law rule that the owner could use only that water overlying his fee. The court rejected this contention, stating that they were bound to the common law only when it was clear and directly applicable. An owner of a portion of a lake was entitled to reasonable use of the entire lake as long as he does not interfere with the rights of others. The court cited tourism as an important consideration in this ruling. (Sisserson-Fla)

ANDERSON V COLLINS)SALE OF SOVEREIGNTY LANDS(.
State of Florida, Tallahassee.

111 So 2d 44-50 (2d D C A Fla 1959).

Descriptors: *Florida, Judicial decisions, *Administrative agencies, Beds, Islands, *Riparian rights, Remedies, Legal aspects, Administration.
Identifiers: *Sovereignty lands, Sale of land.

Appellants brought an action to void the sale of sovereignty lands, islands and submerged lands to private parties. Appellants alleged gross abuse of discretion by the Tenatees of the Internal Improvement Fund, the agency which controls title to the tidal lands of Florida. Appellants, citizens of St. Petersburg, joined the city of St. Petersburg as defendants since, as owners of the upland adjacent to the land in question, they did not raise objections to the sale. Appellants contended that the private parties fraudulently represented that they were the owners of the uplands adjacent to the sovereignty lands to be sold, and that the Trustees failed to investigate that claim. The trial court found that the Trustees carefully and correctly followed the statutory procedure for the sale of sovereignty lands. They satisfied the only objection that was raised. The judgment was affirmed. (Sisserson-Fla)

UNITED STATES V 2979.72 ACRES OF LAND)CONDEMNATION PROCEEDING(.

270 F 2d 707-714 (4th Cir 1959).

Descriptors: *Judicial decisions, *United States, Water law, Legal aspects, *Condemnation, *Eminent domain, Navigable waters, Riparian rights, Market value, Severance, Flow.

Identifiers: Flowage easements.

An electric power company purchased a flowage easement from a riparian owner. Then, the fee owner conveyed the fee to the United States for 1 dollar. The United States after condemning the flowage rights contends that the power company should have no compensation because the right has no value since the power company has no right to use the waters of the navigable stream. The court held that although the power company could not use the stream for power purposes without the United States' approval, the United States could not use the land either as long as the power company possessed the easement. Compensation was thus due for losing the right to flow. The measure of the damage is the difference between the fair market value of the land before and after the taking of the easement. Included in these damages was compensation for severance because the power company in purchasing the easement had also purchased the executory right to sever lands not actually covered by the easement rights. (Childs-Fla)

DIVISION OF WATER RIGHTS AND OTHER INCORPOREAL HEREDITAMENTS; PARTITION OF WATER IN A NATURAL STREAM, ETC.
State of Massachusetts, Boston.

Mass Ann Laws Ch 241, Secs 36-37 (1967).

Descriptors: *Massachusetts, Legislation, *Water rights, *Equitable apportionment, Administration, *Non-navigable waters, Riparian rights.
Identifiers: Division of rights.

Sec 36 provides that joint tenants or tenants in common of an incorporeal hereditament such as a mill privilege or water right may be compelled to divide such right in the same manner as provided in this chapter (relating to partition of land) for division of real property. The commissioners appointed to make the partition shall recommend the best method of setting off the respective shares, and the court may make equity-type decrees and orders pursuant thereto. A sale is authorized, where one of the joint owners so requests. Sec 37 provides that partition may be made of a non-navigable natural stream, where the banks are owned by different riparian proprietors. (Williams-Fla)

DIVISION OF WATER POLLUTION CONTROL.
State of Massachusetts, Boston.

Mass Ann Laws, Ch 21, Secs 26-50 (1967).

Descriptors: *Massachusetts, *Legislation, *Administrative agencies, Water pollution, Water quality, Water conservation, Water districts, Sewage, Industrial wastes, Federal government, Standards, Reservoirs, Pollution abatement, *Water management, Financing.

The Mass Clean Waters Act created the Division of Water Pollution Control to supervise the prevention, control, and abatement of water pollution. These statutes designate the structure and purposes of the division, which include: (1) Encouragement of cities to adopt water pollution plans; (2) Cooperation with federal and state agencies; (3) Research; (4) Adoption of water quality standards; (5) Periodic examinations of water quality; and (6) Preparation of a state water pollution plan. The division is authorized to establish, consolidate, or dissolve water pollution abatement districts. The water resources commission may construct reservoirs to regulate the water flow. The Director of the Division of Water Pollution Control or his representative is authorized to enter any land at reasonable times to inspect or test for water pollution. A $100 per day penalty is provided for persons guilty of causing water pollution. All new outlets for discharge of sewage or industrial wastes require a permit from the division. The director may issue the permit under whatever conditions necessary to protect the water quality. If the conditions are not met the violator may be enjoined by the Supreme Court. (Watson-Fla)

SECS 143-354 ORDINARY POWERS AND DUTIES OF THE BOARD OF WATER RESOURCES--SECS 143-355 TRANSFER OF CERTAIN POWERS, DUTIES, FUNCTIONS AND RESPONSIBILITIES OF THE DEPARTMENT OF CONSERVATION AND DEVELOPMENT AND OF THE DIRECTOR OF SAID DEPARTMENT.
State of North Carolina, Raleigh.

North Carolina Laws Ch 1071, 1117 (1967).

Descriptors: *North Carolina, Legislation, *Administrative agencies, Administration, Long-term planning, Federal government, Project planning, *Water storage, Local government, Political aspects, Wells, *Well regulations, Water use.

Sec 143-354 provides that the Board of Water and Air Resources is to carry out a program of planning and education with reference to conservation and beneficial use of water resources. It is to: (1) investigate local governments' needs for federal water supply storage projects; (2) warn them of impending water shortages; (3) suggest legislation; (4) hold public hearings; (5) adopt rules and regulations; (6) provide federal agencies with assurances of nonfederal cooperation in federal projects; and (7) to assign or reassign to local governments any interests of the state in federal water storage projects. Sec 143-355 sets out the duties of the Department of Water Resources. The Department is to act as an intermediary with the federal government, engage in studies and long-range planning, administer water related programs, and carry on various other activities. Well drillers are required to register with the Department, supply it with samples of cuttings, and furnish certain information upon completion of the well. Upon request, water users may be required to provide water use information to the Department. (Williams-Fla)

GEORGIA WATER QUALITY CONTROL ACT.
State of Georgia, Atlanta.

Ga Code Ann, Secs 17-501--17-530 (1967).

Descriptors: *Georgia, Legislation, *Administrative agencies, Regulations, *Water resources, *Water quality control, Water pollution, Sewage, Industrial wastes, Project planning, Permits, Standards, Surveys, Water purification.
Identifiers: Federal Water Pollution Control Act, *Div for Ga Water Quality Control.

The policy of the Act is to utilize the water resources of Georgia to the maximum benefit of the people. To achieve this result, a water quality control program is established. The composition and organization of the Water Quality Control Board, which administers this program, are described. Among the powers and duties of the Board are: (1) engaging in research related to pollution; (2) determining the existing pollution conditions; (3) preparing a plan for pollution prevention; and (4) establishing standards of water purity. The Act sets forth the powers and duties of the executive secretary for the Division for Georgia Water Quality Control. All employees of the Division are controlled by the state merit system. All facilities, personnel, funds and functions utilized for water quality control by any state agency are transferred to the Division for Georgia Water Quality Control. The Act makes the disposal of sewage, industrial wastes, or other wastes into waters of the state unlawful except when in compliance with the specified regulations. The methods for enforcing and appealing regulations are described. The Water Quality Control Board is the state agency for all purposes of the Federal Water Pollution Control Act. (Childs-Fla)

CANAL COMPANIES.
State of Georgia, Atlanta.

Ga Code Ann Secs 17-101--17-114 (1967).

Descriptors: *Georgia, Legislation, State jurisdiction, *Canals, *Canal construction, *Navigation, State governments.

A petition to the Secretary of State is required of any group of persons desiring to incorporate a company for the purpose of constructing, operating and maintaining a canal. The Secretary of State shall issue a 30 year certificate, to be kept on file. Procedures for organization are set out. The powers of the corporation, such as to make contracts, acquire property and construct canals, are delineated. The corporation may not obstruct navigation, and several other duties and limitations are imposed. The corporation is authorized to enlarge canals, allow others to withdraw waters from their canals, and permit goods to be transported through them. Whenever a canal or its backwaters encroach upon a public road, the corporation must restore the road to its original condition, by the use of bridges, etc., at its own expense. The corporation is authorized to sell, lease or mortgage its property in order to obtain money to maintain its works. The corporations created hereunder shall be subject to taxation. (Williams-Fla)

AN ACT CREATING A POLLUTION CONTROL AGENCY AND CREATING AN OFFICE OF DIRECTOR THEREOF: PROSCRIBING THEIR POWERS AND DUTIES: EMPOWERING THE GOVERNOR TO ACT IN AN EMERGENCY.
State of Minnesota, St. Paul.

Minnesota Laws Ch 882 (1967).

Descriptors: *Minnesota, Legislation, *Administrative agencies, Water quality, *Water pollution control, Administration, *Air pollution, Land use, Solid wastes.

The seven-member Minnesota pollution control agency is created. It is to be broadly representative of skills and experience necessary to carry out the purpose of this act. This agency takes the place of the water pollution control commission, and inherits its powers and responsibilities. The office of director is established, and he shall be appointed by the governor. The director is to organize the commission, is authorized to enter contracts, and is designated the state's agent in applying for, receiving and disbursing federal funds. Assistance from

other state agencies may be required, upon request to the governor. The provisions relating to water pollution are contained in Chapter 115 of the Minnesota Statutes. The powers provided in this act relate to air pollution. A study of solid waste control and land uses in areas affected by air and water pollution is directed. (Williams-Fla)

RATIFICATION OF THE UPPER MISSISSIPPI RIVERWAY COMPACT BY THE STATE OF ILLINOIS.
State of Illinois, Springfield.

Illinois Laws 1967, Ch H 756.

Descriptors: *Illinois, *Interstate compacts, Regional development, Administrative agencies, Legal aspects, Administration, Financing, Taxes, *River basin development, Interstate commissions, *Mississippi River Basin, Legislation, State governments, Federal government, Water law, Water law, Water districts, Water resources development, Planning, Water policy, Standards.

The upper Mississippi Riverway Compact between the states of Iowa, Minnesota, Wisconsin and Illinois is herein set out and ratified by the State of Illinois. The Upper Mississippi Riverway Commission is established. The Commission is specifically empowered to establish and maintain recreational facilities and programs; to promulgate plans for pollution abatement, control of erosion, and diversions of waters; to hold public hearings; and to make contracts. Generally, the Commission's powers are expressed in broad terms with emphasis upon co-ordination of all state and federal programs within the region. Representation on the Commission is required to be equal among member states, and taxes imposed by the Commission and approved by the states' legislatures are to be apportioned equally. Ratification by three states is required to effectuate the compact. A party state may withdraw by enacting a repealing statute. The Director of Conservation in Illinois is appointed as one of the state's commissioners, and fifty-thousand dollars is appropriated to the Commission. (Pfeiffer-Fla)

The purpose of the Illinois 'Pure Waters Development Act' is to provide programs for the conservation, development, use and management of the state's water resources. The Pure Waters Board is empowered to finance programs with funds derived from the sale of bonds pursuant to the 'Pure Waters Development Bond Act.' In Article 2 of the Act, the Pure Waters Board is empowered to match local appropriations in order to complete projects conforming to the comprehensive statewide outdoor recreation plan. It is provided that project priorities be based on the multiple use concept of providing water management along with recreation utilization. Article 3 of the Act empowers the Board to assist in financing local pollution control projects, including sewage treatment facilities. Articles 4 and 5 allow the Board to assist in financing local water supply facilities and state wide flood control projects. In Article 6 the Board is empowered to finance land acquisition for existing state agencies and the construction and development of state water resources projects by existing state agencies. (Pfeiffer-Fla)

CAUSEY V GRAY)BOUNDARY DISPUTE BETWEEN RIPARIAN OWNERS(.

243 A 2d 575-585 (Md 1968).

Descriptors: Riparian rights, *Boundaries (Property), *Riparian owners, Maryland, Judicial decisions, *Landfills, Accretion, *Equitable apportionment, Jurisdiction, Water law, Boundary disputes, Legislation, Relative rights, Remedies, Rivers.

This action involved a boundary dispute between riparian owners. The parties were adjoining owners of riparian land on the Rhode River. The area in front of both parties' riparian land had been filled in. Plaintiff placed a retaining wall and pier along the water's edge. The boundary in dispute was the line from the water's edge to the end of the boundary between plaintiff's and defendant's fast land. Plaintiff sought a declaratory judgement that he was owner of certain land along the boundary. Defendant demurred to plaintiff's complaint on the grounds that plaintiff had an adequate remedy at law in trespass. The court overruled the demurrer, saying thatequitable apportionment of riparian rights could not be obtained in a court of law. The court reviewed statutory changes in the common law of riparian rights in Maryland. (Kirkconnell-Fla)
W69-01344

LANE V MCEACHERN)TITLE TO LAND BETWEEN HIGH AND LOW WATER MARK(.
162 S E 2d 174-176 (S C 1968).

Descriptors: *South Carolina, High water mark, Low water mark, Rice, Judicial decisions, Navigable waters, *Ownership of beds, Swamps, Marshes, Boundaries (Property), Water law, Banks, Navigable rivers, Fresh Water marshes.
Identifiers: *Patents (Land), *Grants (Land).

This was an action for a declaratory judgment as to ownership of land claimed by plaintiff and the State of South Carolina. The land in question is situated on the east side of the Edisto River, a fresh-water navigable river affected by the tide. The land in its natural state was fresh-water river swamp adjacent to the river lying between the mean high and low water marks. The land has been enclosed by banks and used as a rice field since 1794. Plaintiff traces his title to a grant from King George II in 1734. This grant described the land, but made no mention of the low water mark. The State now asserts title to the land below the mean highwater mark. The court held that no justicable issue existed. The state admitted that the described land was in fact granted to plaintiff's predecessor by King George II, and hence the rule of construction that such grants extend only to the highwater mark did not apply. The court further held that since plaintiff had good title to the land, he had a right to maintain the banks around the land. (Kirkconnell-Fla)
W69-01347

SEACOAST WATER COMM'N V CITY OF PORTSMOUTH)RIGHT OF MUNICIPALITY TO WATER SUPPLY(.

203 A 2d 649-656 (N H 1964).

Descriptors: *Eminent domain, Federal Government, Cities, Municipal water, *Water contracts, *Water rights, Prior appropriation, Condemnation, Utilities, Dams, Reservoirs, New Hampshire, Judicial decisions.

The Federal Government attained through power of eminent domain land located in the city of Portsmouth. The water rights of the city were located within this area. In consideration for the city giving up its chief source of water supply, the Government promised to furnish a replacement supply of like quantity and quality. To fulfill the promise the Government deeded to Portsmouth its rights, title, and interest in Bellamy Dam and Reservoir. The plaintiffs in this action alleged that the city of Portsmouth had no appropriative, statutory, or preemptive rights to the water in the Bellamy River project. They further alleged that the city of Portsmouth, and the U S A, as its agent, were depriving plaintiffs of rights and interests in the water. The Supreme Court of New Hampshire tended that the city had the right and power to acquire the water rights in dispute. The rights were received as consideration for giving up their former supply. Also, it is lawful for a municipality to own land in another community for the purpose of a water supply. (Harriett-Fla)
W69-01348

UNITED STATES V 50 FOOT RIGHT OF WAY)COMPENSATION FOR RIGHT OF WAY OVER SUBMERGED LAND(.
337 F 2d 956 (3 CCA 1964).

Descriptors: *Judicial decisions, United States, *Eminent domain, Condemnation, Right-of-way, Legal aspects, Riparian rights, *Beds, Ownership of beds, Federal government, Condemnation value, *Compensation.

The United States brought a proceeding to condemn a fifty-foot right-of-way across a riparian owner's (Bergen Point Iron Works) land above the highwater mark and across such owner's submerged land under Newark Bay. The U S District Court allowed compensation only for the right-of-way across the upland and denied any compensation for use of the submerged land or interference with Bergen Point's access thereto. On appeal, the Third Circuit Court of Appeals held that where a private owner holds title to submerged lands, the United States could condemn a portion thereof without paying compensation only where it was an aid to navigation or necessary to its control. In this case, the mere running of a pipeline over submerged land could not be considered an aid to navigation, and the United States was required to pay just compensation for the use of Bergen Point's submerged land and the interference with its access thereto. (R. F. Williams-Fla)

BURKHART V CITY OF FT LAUDERDALE)RIPARIAN RIGHTS -- INGRESS AND EGRESS(.
168 So 2d 65-70 (Fla 1964).

Descriptors: *Public rights, Judicial decisions, *Florida, Accretions (Legal aspects), *Riparian rights, Easements, Boundaries (Property), Local government, Navigable waters, Riparian land, Relative rights.
Identifiers: *Street easements, Plats.

This was an action by landowners to have themselves declared owners of certain accretions in New River Sound, a navigable body of water in Broward County, Florida. On the original subdivision plat a street easement ran along the water's edge, but the plat specifically reserved to owners of lots along the street riparian rights in the waters of New River Sound. The court determined that at the time of the plat, no land existed between the street easement and the water's edge. The question was whether the accretions in front of petitioners' lots belonged to petitioners, or were a part of the street easement. This court held that due to the specific reservation of riparian rights to lot owners in the plat, title in fee to the accretions was in petitioners', subject to the public right of ingress and egress to the water from the street. The court said the intent of the dedicator controls. (Kirkconnell-Fla)
W69-01353

TAPOCO, INC V PETERSON)PUBLIC RIGHT TO NAVIGABLE ARTIFICIAL LAKES(.

373 S W 2d 605-609 (Tenn 1963).

Descriptors: Tennessee, *Hydroelectric project licensing, Navigable waters, Riparian land, Artificial watercourses, Lakes, Riparian rights, *Ownership of beds, *Recreation, *Boats, Remedies.
Identifiers: *Houseboats.

Plaintiff public service corporation brought suits against defendant owners of houseboats to require the removal of said houseboats from a lake. The lake was the artificial result of plaintiff's construction of a dam across a navigable stream. The lake covered riparian land held in fee by plaintiff. The court held that land, which in its natural state was not covered by any navigable body of water when granted, retains its character of private property when by force thereafter extended artificially, it becomes submerged by a navigable body of water. Therefore, defendants had no right to moor their houseboats. Dicta indicates that while the artificial lake was available for public recreation under the license granted plaintiff by the Federal Power Commission, defendants' houseboats interfered with fishing, boating, and skiing, and should be banned. (Crabtree-Fla)

In a per curiam decision the District Court of Appeals on interlocutory appeal held that the Sarasota County Water and Navigation Control Act (Ch. 57-1853, Special Acts 1957, Laws of Florida) made the Sarasota County Water and Navigation Control Authority, as opposed to Sarasota County, the only permitted party plaintiff in a suit to enjoin littoral owners from further adding to their lands or constructing any islands in the bay without obtaining a permit. Chapter 253, Fla. Stat. clearly reflects this legislative intent. Although the Authority is composed of the County Commissioners, the board members as County Commissioners have no rights as plaintiff in the case, and the trial court's order dropping the County as party plaintiff should be affirmed. MILLER V COPPAGE)DROWNING IN DREDGED HOLE IN NAVIGABLE WATER(.

261 N C 430; 135 S E 2d 1-6 (1964).

Descriptors: North Carolina, Judicial decisions, *Drowning, Swimming, *Hazards, Recreation, *Dredging, Excavation, Safety, Navigable waters, Ownership of beds, Riparian rights.

This was a wrongful death action to recover damages for the drowning death of plaintiff's seven year old son in the Neuse River. Defendant's were sued because plaintiff alleged that their dredging operations created a hazard which proximately caused the boy's death. The public used Neuse River for recreation for many years. At the point of the drowning, the river was shallow and safe for non-swimming children. Defendants, who were not riparian owners, excavated a large hole not far from shore and did not post it. It was held that defendant's had no right to dredge in the navigable river, but that there was no evidence of proximate cause, and a non-suit was proper. Plaintiff did not establish that the boy was a non-swimmer or where the body was found. (Crabtree-Fla)

VOLPE V MARINA PARKS, INC)RIPARIAN RIGHTS(.
220 A 2d 525-531 (R I 1966).

Descriptors: *Rhode Island, *Riparian rights, *Boundaries (Property), Boundary disputes, Riparian land, Judicial decisions, Shores, Water law, Relative rights.

This action involves a dispute between two landowners as to riparian rights. Both claim title through a common grantor. A platted street ran along the bay between Long Point and Shell Point. The original plat showed no land between this street and the water. Complaintant claims a right to wharf into the bay in front of his property, which is shown on the plat as bordering on the street. Respondent claims all riparian rights along the bay between Shell Point and Long Point. Respondent's title is derived from a conveyance of 'lots A and B . . . together with all riparian, water, shore, and fishing rights appurtenant thereto . . . 'located between Shell Point and Long Point. The court held that the grantor intended to convey all riparian rights between Shell and Long Points to respondent's predecessor. Upon abandonment of the platted street, complaintant took only to the center of the street, not to the water's edge; hence complaintant had no riparian rights. Title to the property between the street and the water's edge, and the riparian rights thereto, were in the respondent. (Kirkconnell-Fla)

TREUTING V BRIDGE AND PARK COMM'N)VALIDITY OF SALE OF SUBMERGED LANDS(.
199 So 2d 627-634 (Miss 1967).

Descriptors: *Mississippi, Ownership of beds, Navigation, Legal aspects, Judicial decisions, Navigable waters, Landfills, Land forming, Land reclamation.
Identifiers: Obstructions to navigation.

This involved a sale of an island and submerged lands to the Biloxi Bridge and Park Commission by the State of Mississippi for the construction of a development project. This was held to be a valid exercise by the state as trustee of submerged land, since it would not interfere with navigation, would in fact improve navigation, and would have many other beneficial effects. The state's ownership of submerged lands as trustee for the people of the state is not a constitutional doctrine, but rather a common-law doctrine. A state constitutional provision prohibiting the legislature from authorizing permanent obstructions to navigable waters does not prohibit the sale of submerged lands and subsequent filling of these lands because it is directed toward free navigation and has nothing to do with waters not suitable for navigation or the sale of submerged lands. (P. N. Smith-Fla)
W69-01362

U S V 738.75 ACRES)TITLE TO ACCRETED LAND(.

263 F Supp 608-612 (E D Ark 1967).

Descriptors: *Condemnation, Riparian rights, Riparian land, Water law, Legal aspects, Navigable water, *Accretion (Legal aspects).
Identifiers: Adverse possession.

The question in the condemnation action involved the title to riparian land. The land was formed by accretion on the bank of the Arkansas River. The first party claims the land as being an accretion to his property. The second party claims the land by adverse possession. The court held that under Arkansas law, the title to lands formed by accretion vests in the riparian owner. However, the court found that the second party was in actual adverse possession of the property and thereby gained title to it. (Horner-Fla)

ROSE V STATE)DAMAGES FOR DESTRUCTION OF WATER SUPPLY(.

289 N Y S 2d 553 (App Div 1968).

Descriptors: *Judicial decisions, *New York, Salvage value, Market value, Evaluation, Compensation, Appropriation, *Riparian rights, State governments, *Condemnation value, Condemnation, Landfills, Relocation, Water supply, Road construction, Highways, Project feasibility, Interest rate, Legislation.

Claimant owned land with river frontage upon which he operated a crushed stone and ready-mix concrete business. For highway purposes the State of New York permanently appropriated a portion of the river bed, and in so doing destroyed claimants' existing source of water as well as access to the river, and simultaneously placed fill along this portion of the property thus completely separating claimants' property from the river at this point and destroying the riparian previously enjoyed. The trial court awarded claimants $208,615 for permanent appropriation of riparian rights and destruction of the water system, plus $45,000 for temporary interference with and taking of the water supply. When claimant learned that his existing water source was to be destroyed, engineering tests were conducted to determine whether a sufficient water supply could be found elsewhere on or near the property. The court held that no such plan was feasible and that neither reasonable efforts nor expenditures would have prevented or mitigated the destruction of claimants' water supply. The court affirmed the assessment of damages to improvements by market value of each fixtures less its salvage value. One judge dissented. (Smodish-Fla)

THOMPSON V JOINT DRAINAGE DIST NO. 3-1)FINANCING DRAINAGE DISTRICT IMPROVEMENTS(.
43 N W 2d 326-331 (Iowa 1966).

Descriptors: *Assessments, *Drainage districts, Statutes, Laterals, *Iowa, Judicial decisions, Taxes.

This opinion involves an action to cancel levy of assessments for work done on a portion of a drainage district. The Winnelago-Kossuth Joint Drainage District included eleven laterals and several numbered drainage districts. The work in issue was one on lateral eight and Drainage District No. 22. The cost of the work amounted to about 86% of the original cost plus improvements to the area to be assessed. A statute required notice and a hearing to property owner, affected by an assessment if the estimate and cost of repair exceeds fifty percent of the original total cost of the district plus subsequent improvements. The question for resolution on appeal was whether the percentage limitations were to be applied to the entire joint district or only to the lateral and drainage district affected. The Supreme Court of Iowa held that the percentage must apply to the lateral and drainage district affected, since these property owners would pay the whole bill through assessments. Since notice and a hearing were not provided as directed by the statute, the entire assessment was declared void. (Harriett-Fla)

WINIECKE V SCHEURER)RIPARIAN RIGHTS IN ARTIFICIAL CHANNELS(.
Mich App 178, 141 N W 2d 717-719 (1966).

Descriptors: *Channels, *Spoil banks, Riparian land, *Riparian rights, *Littoral proprietorship, Contracts (Legal aspects), Judicial decisions, Michigan, Land use.

The two defendants along with three others were co-owners of a tract of land fronting on a channel they had built. The defendants purported to sell by land sales contract some lots to the plaintiffs. The agreement restricted the vendors from erecting any structure on the land between the lots and the channel. When later the vendors increased the size of the spoil bank while working on the channel, plaintiffs sought injunctive relief to get the spoil bank removed. The trial court decision to deny injunctive relief was affirmed in this opinion. The bases for denial was: (1) that no riparian or littoral rights were involved since plaintiffs knowingly purchased channel lots; (2) the written agreement was not binding since the two defendants did not have authority to sign for the others. (Harriett-Fla)

BOARD OF EDUCATION OF UNION FREE SCHOOL DIST NO 11 V NYQUIST)DETERMINATION OF HIGH WATER MARK(.
274 N Y S 2d 229-235 (Sup Ct Albany County, N Y 1966). 51 Misc 2d 902.

Descriptors: Water law, Legal aspects, Judicial decisions, Boundaries (Property), *High water mark, Tidal waters, *New York.

This case dealt with the determination of the boundary of a school district which was described as being the high water mark on a certain island in the Atlantic Ocean. The court stated that the high water mark as applied to tidal waters generally means the line marked by the periodic flow of the tide, excluding the advance of the water caused by winds, storms and unusual conditions. The court held that there is no valid reason for giving the term high water mark any other meaning when used to describe a boundary of a school district. (Batchelor-Fla)
W69-01371

ARNOLD V ELLIS)INJUNCTION AGAINST RAISING THE LEVEL OF A POND(.
5 Mich App 101; 145 N W 2d 822 (1966).

Descriptors: *Michigan, *Remedies, Legal aspects, Adjudication procedure, *Flooding, *Boundary disputes, Ponds, Administrative agencies, Dams, Dikes.

Plaintiffs brought suit to determine boundary and to enjoin defendants from raising the level of a pond on their land thereby flooding plaintiffs' land to the west making it impassable thus depriving plaintiff's access to their northern fields. The trial court granted the injunction determining that the level of the pond should remain at 786 feet above sea level in accordance with a 1914 government survey. The court found plaintiffs entitled to equitable relief since damages would be inadequate and no great injury would be done defendants since ample electric power could be produced with a lower pond level. Construing defendant's deed the court held that defendant's boundary line was the edge of the pond plus a strip one rod wide with the pond at the 786 foot level. This court affirmed, holding that the trial court had power to set the level of the pond since the same power granted to conservation boards by the Inland Lake Level Act was merely optional and did not confer exclusive jurisdiction on those agencies mentioned. (Kahler-Fla)

OPINION OF THE JUSTICES)MINERALS ON SUBMERGED LANDS(.
216 A 2d 656-661 (Me 1966).

Descriptors: *Maine, Riparian rights, *Eminent domain, Legal aspects, Judicial decisions, Legislation, Beds under water, Mining, Mine drainage.

The Maine House of Representatives asked the opinion of the Maine Supreme Court as to the legality of a bill which would permit the state's lessee to construct dams on submerged state land in order to mine the minerals under the land, and would permit the state to take riparian rights of bordering landowners by eminent domain with payment of just compensation for the period during which the tidal estuary is drained. The minerals contained in the submerged lands below the low water mark are held in trust by the state for the people. Since there will be no significant impediment to navigation, the temporary damming and draining is permissible. The state's right to do so is paramount and is not subservient to objections of riparian landowners. The landowners are entitled to just compensation for the interference with their riparian rights, and the bill properly allows this. The operation is still a public use, even though it will be carried out by a lessee who pays royalties to the state. The object is the conversion of the public resources to prevent waste, and this is a means to that end. (P. N. Smith-Fla)

BOTTON V STATE)PUBLIC AND RIPARIAN RIGHTS IN NOW-NAVIGABLE WATERS(.
420 P 2d 352 (1966).

Descriptors: *Riparian rights, *Reasonable use, *Washington, *Access, Riparian land, Lakes, Non-navigable waters, Recreation, Judicial decisions, Relative rights, Public rights, Condemnation, Fishing, Remedies.
Identifiers: *Injunction, Remedies (Legal aspects), Police power, Damage (Legal aspects).

This was an action to enjoin the State of Washington from maintaining a public access area on a non-navigable lake. The state acquired a lot on the lake to provide access for the public for the purposes of recreation and fishing. Members of the public so admitted to the lake repeatedly trespassed on plaintiff's property, littered the lake and its shores, stole plaintiff's property, and otherwise rendered the lake undesirable for private riparian owners. The trial court granted a permanent injunction until the state condemned and paid for the plaintiff's riparian rights which the state's licensees had infringed. This court found that the state's licensees' use of the lake constituted an unreasonable use of the lake by a riparian owner. The state was not

required to condemn plaintiff's riparian rights, but the injunction was granted until such time as the state could come up with a plan to police the public's use of the lake. The case contains a lengthy, general discussion of private riparian rights vis-a-vis public rights in non-navigable rights. (Kirkconnell-Fla)

MAYER V GRUEBER)RIPARIAN RIGHTS IN ARTIFICIAL LAKE(.

138 N W 2d 197-205 (Wis 1965).

Descriptors: *Riparian rights, *Ownership of beds, Lake beds, Lakes, Riparian land, Boundaries (Property), Artificial watercourses, Water law, Legal aspects.
Identifiers: Artificial lakes.

The plaintiff in the action sought an injunction to prevent the defendant from trespassing on the waters of an artificial lake. Originally, a 157 acre tract of land was owned by a gravel company and the lake in question was created when gravel was taken from the land. The company sold a 4 acre parcel of the land to the defendant. The deed described the boundary of the property as being along the bank of the lake. The company thereafter sold the remainder of the tract to the plaintiff. The court noted that presumption exists in favor of ownership of a bed of a natural stream by the owner of the bank but that no such presumption exists where an artificial body of water is concerned. They held that the purchaser of property abutting an artificial lake acquires no rights as a riparian owner by virture of land acquisition alone. Unless the vendor conveys the right to use the lake, the purchaser is precluded from either the right of access or use. (Horner-Fla)
W69-01392

WARD V HARWOOD)TITLE TO ISLANDS IN NAVIGABLE RIVER(.

387 SW 2d 318-321 (Ark 1965).

Descriptors: *Arkansas, *Legislation, *Islands, Accretion, Real property, Navigable waters, State government, Water law, Legal aspects, Riparian land, Riparian rights.

The question involves the construction of two state statutes. The first, passed in 1901, said that all land which forms in navigable waters within the original boundaries of a former owner of land upon the stream shall belong to the former owner. The second, passed in 1917, said that all islands formed in navigable streams belonged to the State and set forth the procedure whereby the land commissioner might have the island surveyed and sold. The court held that the 1917 act did not repeal the 1901 act. It construed the 1917 act as saying, in effect, that in all cases where islands are formed in navigable waters and not within the boundary lines of former owners, then the state may sell the island. EVALUATION OF THE LEGAL INSTITUTIONS OF DIVERSION, TRANSFER, STORAGE, AND DISTRIBUTION OF WATER IN KENTUCKY,
Kentucky Univ, Lexington.
A. Dan Tarlock.
Research Report 15, Kentucky Water Resources Institute, Lexington Kentucky, 1968. 111 p.

Descriptors: Legislation, Legal aspects, Permits, Water law, Riparian rights, Planning.
Identifiers: Kentucky Water Law, K.R.S. 151.

In 1966 Kentucky enacted a water use regulation statute which makes important modifications in the common law doctrine of riparian rights by authorizing the state to grant permits for the use of water. The permit system is primarily designed to allow the state to gather the information necessary to conduct long range planning studies. However, the permit system can also be used to apportion water among competing users. The report examined the common law of riparian rights to determine how KRS Ch. 151 had modified it and analyzed some of the legal problems which could arise in the administration of the statute. The standards for granting or denying a permit were examined in light of the purpose of Chapter 151. Important common law modifications such as the abolition of the watershed limitation were considered. The procedural rights of applicants and third parties affected by the issuance of a permit were criticized because they do not provide an adequate hearing and notice procedure. The constitutional questions raised by the failure of the Chapter expressly to protect prior vested rights were considered. The report concludes with an examination of some emerging problems caused by the increased use of the state's water for recreation. (Author)

Identifiers: *Groundwater management, Groundwater mining, Adjudication procedure, Legal aspects, Prior appropriation.

The many problems connected with water and related land resources have been generated by an expanding population, with its consequent needs for water far beyond any before contemplated. Some of these problems include: (1) the need to classify all ground waters as public waters subject to regulation and control by the state; (2) determination of critical ground-water areas; (3) protection of the prior appropriator in extracting ground water from the basin or aquifer; (4) artificial recharge of ground-water areas and their use for storage purposes; (5) control and abatement of ground-water pollution and need for water quality programs; and (6) cooperation between state and Federal agencies in developing all water resources, a new form of creative Federalism. 6F. Nonstructural Alternatives

IOWA NATURAL RESOURCES COUNCIL V VAN ZEE)FLOOD PLAIN ZONING(.

158 N W 2d 111 (1968).

Descriptors: *Iowa, *Flood plains, Legislation, Guiding codes, *Flood plain zoning, Administrative agencies, *Remedies, Permits, Construction, Eminent domain.

The Iowa Natural Resources Council instituted an action for mandatory injunctive relief as to structures constructed without a permit on dependants' land within a flood plain and also for injunction as to further construction. The Iowa Supreme Court construed Chapter 455A of the 1966 Code as allowing mandatory injunction for the removal of existing buildings only where they could be shown to constitute nuisances within the definition of the statute. Injunction relief as to construction in progress or future construction could be obtained merely by showing that it was within a flood plain and proceeding without a permit. Alternatively the statute allowed removal of objectionable structures not amounting to nuisances by eminent domain proceedings. The court upheld the constutionality of the statute since the collective benefit therefrom outweighed any specific restraint. Requiring a permit was deemed no invasion of private property rights. The dissent contended that the statute allowed mandatory injunction for removal of structures constructed without a permit after the enactment of the statute since to deny it is to deny the only effective remedy for an unlawful act. (Kahle-Fla)

Identifiers: Policy regulations, Land-use planning.

Land-use regulations relevant to local interests such as zoning, subdivision controls and building codes are analyzed. It is suggested that non-economic considerations may outweigh the economic ones in deciding the best land use. Four types of arguments for the regulation of flood plains are discussed and criticized. These arguments state that controls of flood plain lands are necessary to protect other land owners or users, the land user against himself, public agencies, and future generations against present land users. Only the first of these is supported. The next is rejected because of its interference with individual freedom, and the third due to the relatively low cost incurred by relief, emergency evacuation, etc., especially when a flood insurance program is used. In order to benefit from the use of the flood plain two approaches are considered; imposing of land use regulations which will protect third parties; and balancing social cost and private gain. While a zoning agency is suggested, it is emphasized that the private sector can make many decisions for itself. Public intervention is considered justifiable in forcing individuals to act without anticipating relief, pay a pre-payment levy for relief, or carry flood insurance. (Richmond-Chicago)

INTERNAL CONDITIONS OF A DIMINISHING BLUE CRAB POPULATION)CALLINECTES SAPIDUS(,
Rhode Island University, Graduate School of Oceanography.
H. P. Jeffries.
PHS Grants WP-00023 and WP-00858, Chesapeake Science, Vol 7, No 3, pp 164-170, 1966. 7 p, 2 fig, 1 tab, 19 ref.

Descriptors: *Crabs, Population, Fish management, Fish physiology, Chemical analysis, Bibliographies.
Identifiers: *Blue crabs.

Abundance of the blue crab, Callinectes sapidus, in Rhode Island estuaries has decreased during the last 30 years. A commercial fishery once existed in areas where the blue crab is no longer found. Composition of the plasma and muscle was studied to see if abnormalities could be recognized. Mean concentrations of total sugars, protein, non-protein nitrogen, phosphate, and chloride did not differ in crabs from two contrasting lagoons; the mean concentrations of lipids and total nitrogen were also independent of the populations's habitat. The concentration of sugars was atypically low compared with reports on crabs from North Carolina. In the plasma, total sugar concentration was directly related to its conductivity; the concentrations of non-protein nitrogen and phosphate were inversely related to chlorinity. Groups of such correlated tests have predictive value and, when further elaborated, they might be applied to the management of the fishery. This investigation was supported by Public Health Service grants WP-00023 and WP-00858. (S. Mayer-FWPCA)

AN INVENTORY AND STUDY OF BEAVER IMPOUNDED WATER IN MISSISSIPPI,
Mississippi State Univ., State College.
Dale H. Arner, James Baker, and David Wesley.
Water Resour Res Inst, July 1967. 49 p, 22 fig, 13 ref. OWRR Project A-009-Miss.

Descriptors: *Beavers, *Ponds, Surface waters, Limnology, Ecology, Fish populations, Trees, Mississippi, Soil chemistry, Water supply, Water table.
Identifiers: *Beaver ponds.

A survey in Miss. has revealed that there are 956 beaver ponds containing 23,673 acres of water. Limnological and ecological studies of randomly selected beaver ponds and feeder streams showed that 58.1% of these ponds had areas suitable for growing duck food. The dry weight of aquatic invertebrates was higher in beaver ponds than in feeder streams. Soil chemistry studies showed a buildup in beaver ponds of phosphate, potassium, and organic matter greater than in feeder streams. Fish population studies indicated there were more game fish in beaver ponds than in feeder streams. Tree damage caused by beavers was estimated at 9.6 cords per acre. A sportsmen and landowners survey in Miss. showed that there was significant interest in developing and leasing beaver ponds for recreational use.

ASCE'S URBAN WATER STUDIES.
ASCE - San Eng Div, Newsletter, p 1, July 1968.

Descriptors: *Design, *Storm drainage, Data collections, Instrumentation, *Rainfall-runoff relationships, *Water quality, Model studies.
Identifiers: *Urban drainage, *Urban hydrology, Storage tanks.

ASCE has initiated a study program on urban hydrology consisting of two projects. 'An Analysis of National Basic Information Needs in Urban Hydrology' is a study to determine the kinds of data needed to improve the design of an urban area's storm drainage facilities; needs for data-collecting instrumentation; and appraisal of the types of networks necessary to collect adequate data. 'A Systematic Study and Development of Long-Range Programs of Urban Water Resources Research' aims to furnish guidelines for initiating and expanding a long-range study on urban water problems; conduct a state-of-the-art study of simulation methods potentially usable for analyzing urban rainfall-runoff-quality processes; and study the requirements for assessment of drainage damage and the use of storage schemes. The non-hydrologic aspects of urban water-resources research needs will also be investigated.

Institute of Nuclear Technology and Hydrogeological Enterprise, Cracow, Poland.
Boguslawa Turkowa, Krzysztof Czauderna, and Jan Tyrala.
Atomic Energy Comm Translation 6810, 6811, pp 55-61, 1968. Translated from Nukleonika, Vol 12, No 1-2, 1967.

Descriptors: *Groundwater flow, *Radioactive isotopes, Wells, Ground water, *Radiation measurement, Piezometers, Water table, Permeability, *Tracers, Infiltration.
Identifiers: Radiometry, Flow patterns, Flow rate, *Dilution method, Flow characteristics, Iodine isotopes, Subsurface flow.

A single-well method is presented to determine velocity and direction of underground waterflow and results of field tests. Flow measurements require that a charge of radioactive tracer of known concentration be placed in a water-filled hole. The concentration of the tracer is measured by radiometric in-hole probes as the water flows from the hole, and is proportional to the flow. Tracer-laden water moving across the drill hole and escaping through the side of the hole will build up radioactivity from the deposited tracer. The flow-direction probe is surrounded by a shield with one open slot through which radioactivity is admitted. The probe is rotated in the hole and the direction of maximum radioactivity indicates the sector on the wall of the hole where water is escaping. Measurements were made in four drill holes to test different subsurface conditions. Comparison of results shows agreement among certain tests and lack of agreement among others. The conclusion was that the investigations will supply material for further study and planning of additional tests. (USBR)

U. OF I. URBANA - CHAMPAIGN

A deep, steel sheet-piled, figure-eight cofferdam with circular steel wales was installed as a temporary substructure during construction of the City of Ottawa Pollution Control Center Project. The soil profile consisted of 90 ft of a very sensitive stiff clay layer overlying 10 ft of till over the bedrock. Typical soil properties are given, the most significant being that the moisture content of the clay at lower levels is above the liquid limit. A lateral pressure of 4000 lb/sq ft applied uniformly from top to bottom was selected for the cofferdam. An attempt was made to measure axial deformation of the struts and lateral deflection of the sheet piling. Whittemore mechanical strain gages were used to measure the axial deflection of the 24WF100 struts. Duplicate readings within three to four scale divisions (1 division equals a stress increment of 150 lb/sq in.) were possible after several months. Wilson Slope Indicator gages were unsuccessful in indicating lateral deflection of the steel piling. Plots of soil pressure inferred from strain measurements vs death for various levels of excavation are given. Excessive pressure created by the ice lens in the exposed sheeting was detected by the instrumentation. (USBR)

THE DEVELOPMENT OF SEISMIC OBSERVATIONS AND APPARATUS IN THE USSR,
E. S. Borisevich, D. P. Kirnos, and D. A. Kharin.
Phys Solid Earth, No 11, pp 728-734, Nov 1967. 7 p, 2 fig, 31 ref.

Descriptors: *Seismology, *Earthquakes, *Seismographs, Seismic waves, Tsunamies, Geophysics, Reviews, Instrumentation, Recording systems, Data processing systems, Seismic design, Oscillographs, Bibliographies, Measuring instruments.
Identifiers: Epicenters, Foreign research, Earthquake focus, USSR, Earthquake zones.

The improvement of seismic instrumentation and capabilities in the USSR in the last 50 yr is reviewed. Earthquake studies in Russia began in the second half of the 19th century, and a Permanent Central Seismic Commission was formed in 1900. Eighteen seismic stations had been established and 4000 earthquakes recorded by 1908. Epicenters could not be located because of the unsatisfactory quality of the equipment and seismograms. Seismology in Russia was improved from 1902-1906 by Academician B B Golitsyn and associates. Under the Soviet government the range of observations and the arsenal of instrumental equipment required have increased greatly in quality and quantity and have contributed to the present high level of seismology in Russia. The development of tsunami warning stations in the Kuril Islands is of particular interest. These are arranged so that the location of an earthquake and its magnitude can be quickly determined and, in case of tsunami danger, warnings can be sent to settlements that might be threatened. STRESSES AGAINST UNDERGROUND STRUCTURAL CYLINDERS,
Massachusetts Institute of Technology, Cambridge. Kaare Hoeg.
Proc Amer Soc Civ Eng, J Soil Mech Found Div, Vol 94, No SM4, pp 833-858, July 1968. 26 p, 14 fig, 4 tab, 16 ref, 3 append.

Descriptors: Stress distribution, Culverts, *Underground structures, Pipes, Cylindrical shells, *Soil pressures, Lateral forces, Flexibility, Bending moments, Elastic theory, Sands, Flexible tubing, Soil mechanics, Mathematical analysis, Structural behavior, Laboratory tests, *Pressure distribution, Models, Bibliographies.
Identifiers: *Soil-structure interaction, Pipe bedding, Plane strain, Pipe tests.

The magnitude and distribution of static normal soil stresses against underground structural cylinders are studied. Results of laboratory tests on 4.5-in.-dia cylinders buried in dry sand are presented. Test cylinders were split into longitudinal segments, and the force acting on each 30-deg arc of the soil-structure interface was measured. The experimental program included buried cylinders varying from almost perfectly rigid to flexible, encased in sheets of foam rubber. Analytical solutions for contact pressures and deformations are expressed by two nondimensional stiffness parameters relating flexibility and compressibility of the structural cylinder to the compressibility of a solid soil cylinder. For a perfectly rigid cylinder buried deeper than one cylinder diameter, the crown pressure is approximately 1.5 times the applied vertical pressure and the side pressure is 0.25 times the applied vertical pressure, independent of the soil modulus. The crown pressure will be approximately 0.7 times applied vertical pressure and the side pressure will be approximately 0.9 times applied vertical pressure after the flexibility ratio has exceeded a certain magnitude. COMPARISON OF ANALYTICAL AND STRUCTURAL BEHAVIOR RESULTS FOR FLAMING GORGE DAM.
Bureau of Reclamation, Denver, Colo.

Bur Reclam Res Rep No 14, 1968. 21p, 12 fig, 4 tab, 11 ref.

Descriptors: *Arch dams, *Concrete dams, Stress analysis, Deflection, Dam design, Instrumentation, Strain measurement, Computers, Temperature, Measuring instruments, Thermal stress, Data collection systems, Creep, *Structural behavior, Plumblines, Elasticity modulus, Dams.
Identifiers: Flaming Gorge Dam (Utah), Utah, *Trial-load method.

Efficacy of the trial-load method and reliability of assumptions used in the design and analysis of concrete arch dams can best be demonstrated by comparing analytical results with deflections and stresses from structural behavior measurements for an existing dam. Instruments that indicate length change, temperature, and deflection were installed in Flaming Gorge Dam; readings were recorded at scheduled intervals. An electronic computer was used to reduce the data to stresses, temperatures, and deflections. Stress and deflection changes were determined for 2 incremental loadings. Changes from Oct 9, 1963, to Mar 26, 1964, show the effects of seasonal temperature variation. Reservoir water and tailwater levels remained essentially constant during this period. Changes from Mar 26, 1964, to Mar 6, 1966, are the effects of a rise in reservoir water level. Average concrete temperatures were approximately the same for both dates; the tailwater level remained constant over the entire period. Trial-load analyses were made for the same incremental loadings, using an electronic computer. Comparisons of stress and deflection changes for each loading increment are presented. Agreement between analytical studies by the trial-load method and structural behavior results is very close. (USBR)

DESIGN STUDIES OF IDIKKI ARCH DAM,
Central Water and Power Commission, India.
L. V. Kunar, and C. S. Jain.
Indian J Power River Val Develop, Vol 18, No 4, pp 136-148, Apr 1968. 10 p, 5 fig, 3 photo, 5 tab.

Descriptors: *Arch dams, Concrete dams, Underground powerplants, Model tests, Elastic deformation, Mass concrete, Tunnels, *Dam design, Joints, Dam foundations, Mapping, Aerial photography, Foreign projects, Geologic investigations, Preliminary investigations, Seismic investigations, Design criteria, Structural models, Gneisses.
Identifiers: In situ tests, India, *Idikki Dam (India).

The Idikki Hydroelectric Project in the Periyar Valley of Kerala State, India, contains a large reservoir formed by 3 dams. Water will be diverted into an adjacent basin by a 6480-ft power tunnel, 2 pressure shafts 3300 ft long, and the tailrace tunnel. There is an underground powerplant with 6 units of 130 MW. With an average head of 2181 ft and a continuous draft of 1440 cu ft/sec, the units can generate 780 MW of power at about a 30% load factor. A survey for locating the tunnel and penstocks was made by aerial photography. The foundation investigation included tests on cores and in situ dynamic tests by ultrasonic and seismic methods. The foundation at the Idikki damsite is composed of tightly foliated gneisses with bands of charnokites and is traversed by innumerable joints. Bureau of Reclamation design criteria were generally used for the arch dam. The preliminary design analysis used the crown cantilever method in which the total load was assumed to be distributed between the cantilever and arches. Structural model tests considering only the effect of water load were performed in the CWPRS Laboratory, Poona. (USBR)

CONTRIBUTION TO THE OPTIMIZATION OF SYSTEM OPERATION BY THE CHOICE OF SUITABLE METHODS OF CALCULATION FOR TRANSIENT STABILITY,
Dresden Technical Univ, Germany.
K. D. Wessnigk, H. Koettnitz, and H. Schulze.
Int Conf Large High Tension Elec Syst, Paris, France, June 1968. Pap 32-11, 9 p, 7 ref, 7 append.

Descriptors: *Transients, Operations, Calculations, Computers, Errors, Electric power, Transmission (Electrical), Optimum use, *Power system operations, Electrical networks, Voltage regulators, Electric potential, Faults (Electrical), *Electrical stability, Disturbances.
Identifiers: Liapunov Theorem, *System stability (Elect), Synchronous machines, Foreign research, Germany, Switching surges.

The behavior of faults must be considered when planning a system, determining optimum operation, or optimizing a power system by process-control. Transient stability loss is a serious disturbance that can be avoided through proper interpretation of previous calculations and corresponding corrective action. Digital, hybrid, and analog computers can be used for these calculations. Important factors in transient stability calculations include saliency effects, voltage and power regulation, damping, transient characteristic curves of the load, resynchronization, and in special cases the probability for synchronous operation of single units. Reasons for transient instability include faults, switching loads, and network changes. Transient stability is treated by calculating the steady state and initial values, setting up equations of motion of machines, and solving these equations. Methods of solution are discussed. Limitations of computer application and influencing factors are considered. For each calculation, the main points to be considered are given, independently from the method used. (USBR)

Identifiers: Spinning reserve, *Tie lines, Interties, Hungary, Foreign research, Outages, *Interconnected systems, Gaussian distribution.

The effect of large-size generating units on the transmission capacity of interconnecting tielines is investigated. The following aspects are considered: (1) benefits to the national economy resulting from the interconnection of systems; (2) transmission capacity of interconnections permitting maximum utilization of economic benefits resulting from intersystem cooperation, (3) the required economical spinning reserve, and (4) the means necessary within the interconnected systems to ensure service continuity. A hypothetical system demonstrated the effects of unit size on the capacity of interconnecting tielines. A static and dynamic method is proposed for determining the benefits of interconnection of power systems, regarding emergency help, economical load dispatching, and establishing a system development policy. The problem of economical spinning reserve is considered, and a survey of measures ensuring service continuity of integrated systems is given. An algorithm is presented for computing the histogram of power exchange between interconnected systems. (USBR)

Loss of large generators or tripping of heavily loaded transmission lines momentarily results in transient stresses on a network that may be less than those occurring after transient line faults with rapid disconnection and autoreclosing. Tripping of generators or lines may set up such severe undamped swings on the system that some synchronous machines will fall out of synchronism and eventually in chain reaction lead to a complete breakdown. Line tripping and loss of large power units may be among the factors most important for stability. The steady state stability after the fault, and the transition from transient to steady state conditions become decisive factors. Investigations are important to determine how the transmission capacity is affected by such factors as design of power-frequency regulation equipment, load characteristics, and voltage regulation. Two methods of calculating the dynamic behavior of the system are compared with field tests of the transmission capacity of a tieline connecting a Norwegian 130-kv network with the Swedish network. The Churchill Falls Development, located 800 mi northeast of Montreal, will generate 5000 mw and 30 billion kwh of power. Transmission of this power has been studied extensively by Hydro-Quebec. The reliability of ehv a-c transmission is discussed from experiences available after 2 yr operation of the Hydro-Quebec 735-kv network. The possibilities of hvdc transmission are investigated. Application of these 2 technologies to Churchill Falls is made by technical and economic comparisons. Results apply only to the particular problem, but general trends in ehv transmission are indicated. Studies made by Hydro-Quebec in selecting the transmission system from Churchill Falls to Montreal are discussed. The extension of the Hydro-Quebec network to incorporate Churchill Falls presented a choice of extending the use of 735-kv a-c transmission or embarking on hvdc transmission. This paper assesses the possibilities of a-c and d-c transmission; while the analysis concerns Churchill Falls problems, the main objective is to evaluate the future of ehv transmission. (USBR)

INSULATION CO-ORDINATION IN EHV SYSTEMS WITH LOW INSULATION LEVELS -- A SURGE DIVERTER PROBLEM,
B. Thoren.
Inst Eng, Aust, Elec Eng Trans, Vol EE4, No 1, pp 31-36, Mar 1968. 6 p, 7 fig, 2 tab, 10 ref, disc.

Descriptors: *Extra high voltage, *Electric insulation, *Coordination, Lightning, Circuit breakers, Alternating currents, Resistors, Electrical networks, Capacitors, Computers, Electrical equipment, Stress, Foreign countries, Power transformers, *Surges.
Identifiers: *Switching surges, *Surge diverters, *Overvoltage, Basic impulse level, *Protection (Electrical), Sweden, Electrical insulators.

Insulation coordination is a problem in ehv systems with low insulation levels because of the comparatively low insulation withstand strength against switching overvoltages. An application philosophy for surge diverters is outlined, in which a distinction is made between surge diverters used only for protection against lightning overvoltages and those used also for protection against switching overvoltages. The choice of suitable sparkover characteristics and discharge abilities of surge diverters is discussed. A flat sparkover characteristic is desirable when the surge diverter is used for protection against all types of overvoltage. A computer study of the phenomena occurring with line switching shows that a surge diverter with a low sparkover voltage must be able to handle repeated discharges with high energy contents. (USBR)

FUNDAMENTALS OF HVDC INTERRUPTION,
W. Pucher.
Electra--CIGRE, No 5, pp 24-38, June 1968. 15 p, 10 fig, 18 ref.

Descriptors: *Extra high voltage, Energy, *Direct currents, Resistors, Electric currents, Inductance, Magnetic induction, Electric insulation, *Circuit breakers, Faults (Electrical), Electric potential, Dielectrics, Bibliographies, Extra long distance, Capacitance, Rectifiers, Control systems, Capacitors.
Identifiers: *Switching surges, *Overvoltage, Short circuits, Sweden, Foreign research, Switching.

Various switching operations that may be expected when breaking devices are applied to hvdc transmission show 6 typical cases: (1) clearance of faults close to the converter station, (2) clearance of faults at a remote point on the transmission line, (3) interruption of load currents without transmission line, (4) interruption of load currents with transmission line, (5) interruption of load currents on parallel lines, and (6) switching of lines under no-load conditions. The first 5 methods of d-c interruption and their reaction on a circuit breaker are studied, using an equivalent circuit. The sixth method does not present any major problem in d-c interruption. HVDC transmissions now in service are operated in conjunction with special current-control systems, and short-circuit fault currents are limited to values not much in excess of normal load currents. The amount of magnetic energy in the circuit will be about the same for normal load and

short-circuit fault currents. The magnetic energy of the system will increase with higher currents and longer lines; energy released in the breaker will depend on the switching voltage and the type of current control used. (USBR)

STUDY OF OVERHEAD GROUND WIRES FOR DC TRANSMISSION LINES,
Cairo Univ., Giza, Egypt.
Mohamed M. Khalifa.
Inst Elec Electron Eng Trans Power App Syst, Vol PAS-87, No 7, pp 1648-1656, July 1968. 9 p, 7 fig, 2 tab, 1 ref, disc.

Descriptors: *Direct currents, Transmission lines, Interference, Field tests, *Electrical coronas, *Radio interference, Telephones, *Electrical grounding, Laboratory tests, Instrumentation, Measurement, Ionization, Energy losses, Models, Losses, Electric currents, Electrical engineering.
Identifiers: *Overhead ground wire, Bipolar transmission lines, United Arab Republic, Test results, Foreign research, Induced voltage.

Experimental and calculated results are presented of a study on the influence of overhead ground wires on corona losses, radio interference (RI), and telephone interference of d-c lines. Corona losses and RI were measured on a full-scale bipolar test line. Corona losses were measured on laboratory models of monopolar, homopolar, and bipolar lines. Telephone interference levels were obtained by computer. Ground wires cause a considerable increase in corona losses of monopolar and homopolar d-c lines. Two ground wires on a bipolar d-c line cause a significant increase in corona losses only at voltage gradients close to the inception level, and cause a reduction in RI at higher voltages. Insulated ground wires have no significant effect on corona losses on d-c lines, but acquire voltages that may reach a considerable percentage of the line voltage. Ground wires above the high-voltage conductors of d-c lines raise the interference level in adjacent telephone circuits; the effect is slight at locations near line terminals. (USBR)

NEW DEVELOPMENTS IN HIGH-VOLTAGE MINIMUM OIL CIRCUIT BREAKERS,
Micafil Ltd., Zurich, Switzerland.
Urs P. Gugelmann.
Inst Elec Electron Eng Trans Power App Syst, Vol PAS-87, No 7, pp 1613-1622, July 1968. 10 p, 12 fig, 2 tab, 4 ref, disc.

Descriptors: *Circuit breakers, Interrupters, Electric power, Electric currents, Design, *Electrical equipment, Resistors, Field tests, Faults (Electrical), Test procedures, Hydraulic systems, High pressures, Power O and M, Reliability.
Identifiers: Insulating oil, Foreign research, Switzerland, Oerlikon Eng. Co. (Zurich).

A new restrike-free, fast-acting, minimum oil circuit breaker for the 60- to 500-kv range is described. The breaker can be equipped with interrupters for either 40,000 or 60,000 amp, providing a maximum symmetrical interrupting capacity of 50,000 mva. The modular-type breaker is built from self-contained, identical, and interchangeable basic building elements. The breaker is practically noiseless, has vibration-free operation, has a reliable drive precluding any undue action, and is fast and simple to erect and maintain. Arcing time is independent of the interrupted current because of an effective oil injection system. Fully hydraulic operation of the contacts eliminates the use of mechanical transmission and springs. Test results confirm that the breaker's performance exceeds standard requirements; it is insensitive to high rates of recovery voltage. (USBR)

TOKYO'S OUTER LOOP SYSTEM,
Tokyo Electric Power Co., Inc., Japan.
Ichiro Hori.
Energy Int, Vol 5, No 8, pp 12-15, Aug 1968. 4 p, 4 fig, 1 tab.

Descriptors: *Extra high voltage, Electric power, Reliability, Safety, Power system operations, Foreign construction, Distribution, Planning, Electric power demand, Electric power production, Thermal power, Thermal powerplants, Coordination, *Transmission (Electrical), Pumped storage, Hydroelectric power, Transmission lines.
Identifiers: Japan, *Electrical design, *Interconnected systems, Load centers, Underground cables, Fossil fuels.

This paper discusses progress being made by the Tokyo Electric Power Co. for modernizing power supply facilities in Tokyo to meet the predicted expansion in consumer demand. Since 1960, the 275-kv outer loop system has been strengthened by making it a double-circuit system functioning as a ring surrounding the load center in Tokyo. The voltage of this system will be raised to 500-kv operation to match voltage on the trunk lines as their voltages are increased to meet demand. The ehv system will be extended into the center of Tokyo through 275-kv underground cables. A 300-mw d-c frequency converter station has been installed, making it possible to interconnect the 50-cycle Nagoya loop with the 60-cycle Tokyo loop for coordinated operation and improved system reliability. The outer loop system permits time diversity of different loads and waterflow diversity of different rivers to be used effectively for economic operation of the overall systems of the company. (USBR)

THE SENECA PUMPED-STORAGE PLANT,
Cleveland Electric Illuminating Co., Ohio.
Seymour B. Rock.
Proc Amer Power Conf, Vol 29, pp 720-730, 1967. 11 p, 8 fig, 3 ref.

Descriptors: *Pumped storage, *Hydroelectric powerplants, Draft tubes, Planning, Reservoirs, Design data, Intake structures, Penstocks, Optimum design, Pressure pipes, Conduits, Asphaltic concrete, *Pump turbines, Hydraulic turbines, Electric generators.
Identifiers: Pennsylvania, *Seneca Pump Storage Plt (Pa), Synchronous machines.

The 3-unit Seneca Pumped Storage Plant on the Allegheny River about 200 mi upstream from Pittsburgh, Pa., will have a rated capacity of 380,000 kw and is scheduled for service in mid-1969. Power facilities are being installed adjacent to the concrete-earthfill Kinzua Dam constructed by the Corps of Engineers. The floor of the upper reservoir, located on a plateau adjacent to the left abutment of the dam, will be about 700 ft above the water level behind the dam and 800 ft above the elevation of the river below the dam. Phases of the work discussed include: (1) planning considerations; (2) plant description; (3) design highlights, including synchronous starting, a divided draft tube, and an asphaltlined upper reservoir; and (4) optimizing plant design. The Pennsylvania Electric Co and The Cleveland Electric Illuminating Co made the planning studies; Harza Engineering Co performed engineering and construction management services. (USBR)

EVALUATION OF HARMONIC LEVELS ON AN HVDC TRANSMISSION LINE,
Allis-Chalmers, Milwaukee, Wis; University of Wisconsin, Madison.
D. H. Welle, A. G. Phadke, and D. K. Reitan.
Proc Amer Power Conf, Vol 29, pp 1100-1108, 1967. 9 p, 6 fig, 7 ref, append.

Descriptors: *Direct currents, *Extra high voltage, Waves, Rectifiers, Transmission lines, Converters (Electrical), *Interference, Attenuation, Graphical analysis, Analysis, Filters (Electromagnetic), Electric power, Resonance, Disturbances.
Identifiers: *Evaluation, *Harmonics, Propagation, Interties.

Using symmetrical components, the author discusses a convenient means of analyzing harmonic levels occurring on d-c transmission lines. The valve element of an hvdc converter functions as a switch, opening and closing in a predetermined sequence, and creating cyclic disturbances on the d-c system. Voltage discontinuities appearing on the output d-c voltage can create harmonic content in excess of 10 to 15%. An analysis based on the concept of steady-state traveling waves provides an insight into factors influencing harmonic levels and is useful in designing filters for d-c transmission lines. A normalized graph aids in determining the harmonic variation along the transmission line. Equations for computing the harmonic level along the line and a method of deriving the normalized graph are given. (USBR)

Identifiers: *Switching, *Switching surges, Current rating, Flashover, Overvoltage.

During the past 5 yr the electric power industry has made greater use of extra high voltage (345 and 500 kv) to transmit large blocks of power over extra long distances. There are 2 requirements of ehv system operation that can impose new capability requirements on circuit breakers for use in high-voltage systems operating in conjunction with ehv lines, either at the source or at load terminals. These are: (1) control of ehv line voltage surges on closing of low-side circuit breakers switching ehv lines on the low-voltage side of a transformer, and (2) continuous current ratings up to 3000 or 4000 amp to carry load currents associated with ehv line loadings. This paper reviews the general usage of resistors in circuit breakers, and through definition of the functions of various ohmic values of resistors used, introduces the application of surge control resistors in oil circuit breakers for low-side switching of ehv lines. A description is given of the development of breakers in the 115- and 138-kv class with continuous current ratings up to 4000 amp for carrying kva loads corresponding with ehv line capabilities. GIANT-SIZED HYDRAULIC TURBINES,
Bechtel Corp., San Francisco, Calif.; Acres Ltd., Toronto, Canada.
J. L. Haydock, and J. Gavin Warnock.
Amer Power Conf, Apr 1968. 36 p, 8 fig, 9 tab.

Descriptors: *Hydraulic turbines, Pump turbines, *Forecasting, Design, Manufacturing, Erection, Transportation, *Reviews, Economics, Mechanical engineering, Capital costs, Technology, Fabrication, Handling equipment, Foreign design practices, *Turbines, Specific speed.
Identifiers: Bulb turbines, *Hydraulic design, Canada, Tube turbines, Foreign research.

The past 25 yr of turbine building progress is reviewed, and predictions for 1980 are considered. Important aspects in the development trends of

hydraulic turbines that must be considered when forecasting the future include: (1) pressure applied by optimum economic development of hydropower sites; (2) advances in technology, particularly as applied to manufacturing and material techniques; and (3) function of the large hydraulic turbine in relation to power systems of the future. All facets of the economics of large hydraulic turbines that must be carefully considered are discussed. Modern technology indicates that hydraulic design will in no way limit the advance to the 2,000,000-hp frontier by 1980. Tabluations are given of large hydraulic turbines in operation, under construction, or planned. Large pump-turbines and bulb and tube turbines are listed. (USBR)

8D. Soil Mechanics

CHANGES IN THE PROPERTIES OF SETTLED LOESSIAL SOILS WITH DEPTH AFTER COMPACTION OF THE SOILS BY WETTING AND THE EFFECTS OF BLASTING,
I. M. Litvinov.
Transl from Osn Fundamenty i Mekh Gruntov, No 6, pp 24-25, 1967. Soil Mech Found Eng, No 6, pp 419-421, Nov-Dec 1967.

Descriptors: *Soil compaction, *Loess, Compaction tests, Soil physical properties, *Settlement, Explosions, Soil consolidation tests, Porosity, Blasts, *Compaction, Density, Moisture content, Soil mechanics, Foreign construction, Costs, Dynamics.
Identifiers: Blasting, Soil dynamics, Soil density, Foreign research, USSR.

The author presents a method of deep compaction of settled loessial soils by wetting and then subjecting the soil to the effect of blasting. Data on changes in properties of such soils with depth before and after compaction are presented. The method makes possible reduction of the danger of wet zones, more rapid compaction, and development of greater density. A graph of the soil density after compaction in tons/cu m vs depth indicates densities of 1.4 at 1 m, 1.47 at 3 m, 1.4 at 5 m, increasing to 1.62 at 10 m, and continuing near 1.62 to 20 m. The percent porosity of the soil vs depth shows 47.5% at 1 m, 46% at 3 m, 49% at 5m, decreasing to 40% at 20 m before blasting. The porosity was 47% at 1 m after blasting and decreased to approximately 40% at 10 m. The dynamic factor (blasting) reduced the thickness of the upper uncompacted zone of settled soil at one test site from 7-9 m to 4-6 m. The approximate cost/sq m of a layer compacted to 15 m was 7 rubles, 50 kopeks ($7.50). The method appears to be economical and reliable. (USBR)

COMPOSITIONAL AND ENVIRONMENTAL INFLUENCES ON THE STRESS-STRAIN-TIME BEHAVIOR OF SOILS,
California Univ, Berkeley.
Terence J. Hirst, and James K. Mitchell.
Soil Mech Bitum Mater Res Lab Rep No TE 68-4, Univ California, Berkeley, Apr 1968. 242 p, 70 fig, 10 tab, 63 ref, 3 append.

Descriptors: Clays, Cohesive soils, Compressive strength, Creep, Grain shapes, Consolidation, Failure (Mechanics), Gradation, Grain sizes, Soil structure, Kaolin, Sensitivity, Shear tests, Triaxial compression, *Clay minerals, *Soil texture, *Stress-strain curves, Triaxial stress, *Soils, Soil mechanics, Bibliographies, Time, Sands.
Identifiers: Strain rate, Compressibility, Undrained shear strength, Illite.

Influences of the clay mineral type, and the grain shape and size distribution of nonclay particles on consolidation, strength, and creep characteristics of prepared sand-silt-clay mixtures can be interpreted in terms of interactions between the clay and granular phases. The interference between clay and nonclay phases that develops during consolidation prevents either phase from consolidating to the void ratio it would attain in the absence of the other phase. The stiffness of normally consolidated mixtures varies with clay content but is essentially independent of the grain size distribution and particle shape characteristics of the granular phase. Adding granular particles to a sand-silt-clay mixture may result in increased or decreased strength at a given consolidation pressure, depending on whether the strength increase provided by the granular phase exceeds the strength reduction in the clay phase that results from the additional interference to clay consolidation caused by the granular phase. Changes in undrained strength occurring during sustained loading depend on the creep stress level, duration of load application, and clay type, but are independent of the consolidation pressure and type and amount of the granular phase. LANDSLIDES DURING EARTHQUAKES DUE TO SOIL LIQUEFACTION,
California Univ., Berkeley.
H. Bolton Seed.
Proc Amer Soc Civ Eng, J Soil Mech Found Div, Vol 94, No SM5, pp 1053-1122, Sept 1968. 70 p, 66 fig, 1 tab, 73 ref.

Descriptors: *Earthquakes, Faults (Geology), *Landslides, Void ratios, *Liquefaction, Rock mechanics, Seismic waves, Seismic properties, Lenses (Soils), Bibliographies, *Seismic investigations, Seismology, Pore water pressures, Stability analysis, Saturation, Shear strength, Sands, Pore pressures.
Identifiers: Stability, *Slope stability, Terzaghi lecture, *Seismic stability, Soil dynamics, Earthquake damage.

The 4th Terzaghi lecture has 2 main objectives. First, frequency and conditions of occurrence of landslides due to soil liquefaction during earthquakes are examined. In addition to discussing individual events during particular earthquakes, a list of known slides in which liquefaction has played a part is included to evaluate the severity of the problem. A review of the list shows that the slides have been initiated by liquefaction of saturated sandy soils in a loose to medium dense condition resulting from earthquakes varying in magnitude from 5.5 to 8.5 points (Richter) and at epicentral distances of several miles to hundreds of miles. This type of slide must be seriously considered in seismically active regions. The second objective is to emphasize the importance of minor geologic and technical details in determining the occurrence and nature of landslides during earthquakes due to soil liquefactions. (USBR)

AN ANALYSIS OF THE SHEFFIELD DAM FAILURE,
California Univ., Berkeley and Los Angeles.
H. Bolton Seed, K. L. Lee, and I. M. Idriss.
Soil Mech Bitum Mater Res Lab Rep No TE-68-2, Univ California, Apr 1968. 101 p, 44 fig, 2 tab, 13 ref.

Descriptors: *Dam failures, *Dam foundations, Embankments, Compaction, Soil stability, *Stability analysis, *Earth dams, *Earthquakes, Seismic investigations, Seismic properties, Shear strength, Liquefaction, Sands, Impervious blankets, Cutoff trenches, Safety factors, Soil liquefaction, Silts, Seismic design.
Identifiers: Earthquake engineering, Earthquake damage, Soil dynamics, *Sheffield Dam (Calif), Seismic studies, Cyclic loads, Seismic stability.

An attempt is made to reconstruct the circumstances leading to the Sheffield Dam failure during the 1925 Santa Barbara earthquake. Field observations and dynamic analyses indicate that failure was caused by liquefaction. The downstream slope failed because the upstream slope was supported by the 15- to 18-ft-deep reservoir. The 25-ft-high dam was constructed of silty sand on a foundation of similar material about 6 ft thick. The embankment was compacted by equipment travel to a relative density of about 35%. The foundation and lower portion of the embankment were saturated by seepage. The earthquake had a magnitude of about 6.3 with an epicenter located about 7 mi from the damsite. Resulting ground accelerations had a maximum amplitude of about 0.15 g, a frequency of about 3 cycles/sec, and a duration of significant shaking of 15 to 18 sec. Dynamic response analyses indicate the dam was probably subjected to a series of earthquake-induced inertia forces equivalent to 10 uniform force cycles at maximum amplitude. Cyclic-loading triaxial compression tests indicated a factor of safety of 1.15 against failure by soil liquefaction. A similar analysis using results of simple shear tests indicated a factor of safety of 0.75 and a failure surface in good agreement with the actual one. (USBR)

A STUDY OF PORE WATER PRESSURES DURING ELECTROKINETIC TREATMENT,
Cornell Univ., Ithaca, N. Y.
Melvin I. Esrig.
Soil Eng Ser Res Rep No 6, Cornell Univ, Ithaca, N Y, Mar 1968. 87p, 42 fig, 2 tab, 17 ref, append.

Descriptors: *Pore water pressures, *Negative pore pressures, *Pore pressures, Consolidation, Electroosmosis, Electrophoresis, Boundaries, Soil stabilization, *Electrokinetics, Electrolytes, Bibliographies, Soil physical properties, Soil mechanics, Soil chemical properties, pH, Soil consolidation tests, Ions, Permeability, Piezometers.
Identifiers: Soil water movement, Soil conductivity.

Pore water pressures in soils during electrokinetic treatment are considered on a semitheoretical basis. Results of an experimental program on problem areas are given. The work was sponsored by the U S Army Materiel Command as a feasibility study of soil stabilization for military mobility. Pore water pressures in soils may be due to various causes, one being an externally applied hydraulic head. Only pressures from a potential field (transmitted to the soil through electrodes) or from physical-chemical changes in the soil are discussed. Pore water pressures in cylindrical soil samples under a uniform potential field were investigated for systems with: (1) water at one end, (2) water at both ends, and (3) both ends closed. The negative pore pressure of 5 psi was measured. Changes in pH, ion concentration, and applied voltage were interrelated and influenced pressures in soils subjected to electrokinetic treatment. Pore water pressures will develop even in a uniform field where water has access to the sample; they are related to discontinuities in pH, ion concentration, and the electric field. (USBR)

A FEASIBILITY STUDY OF ELECTROKINETIC PROCESSES FOR STABILIZATION OF SOILS FOR MILITARY MOBILITY PURPOSES,
Cornell Univ., Ithaca, N. Y.
Melvin I. Esrig.
U S Army Eng Waterways Exp Sta Rep 4, July 1967. 86 p, 25 fig, 5 tab, 23 ref, 2 append.

Descriptors: *Soil stabilization, *Electrokinetics, *Soil treatment, Montmorillonites, Quartz, Shear tests, Vane shear tests, Consolidation, *Shear strength, Electrical properties, Permeability, Electroosmosis, Clays, pH, Soil mechanics, Bibliographies.
Identifiers: *Soil strength, Illite.

Results are presented of a laboratory investigation of the effects of electrokinetic treatment on the strength of consolidated samples of illitic and montmorillonitic soils. Samples were remolded specimens of sifted illite and montmorillonite mixed with a manufactured quartz silt. Average strength increases of from 1.5 to 40 times occurred when samples were treated electrically for 96 hr. Although strength increases for montmorillonitic samples are similar in magnitude to those occurring in illitic samples, they could not be related to the clay fraction. Electrokinetic treatment is most beneficial when the ratio of energy input per unit volume of clay fraction is the greatest. This indicates that electrokinetic treatment is most useful in soils with clay contents of between 5 and 20%. The coefficient of electrokinetic permeability varied throughout the treatment period. An equation is suggested relating this coefficient to several soil index properties. (USBR)

8E. Rock Mechanics AND Geology

SLOPE STABILITY PROGRAM OF KENNECOTT COPPER CORPORATION,
Kennecott Copper Corp, New York, N Y.
Carl D. Broadbent.
Amer Inst Mining Eng Annu Meet, New York, Feb 1968. 31 p, 11 fig, 12 ref.

Descriptors: *Critical slopes, *Cut slopes, *Landslides, Optimum use, Stress, *Stability analysis, Models, Materials stability, Ground water, Shear strength, Shear failures, Rock mechanics, Three-dimensional, Pits, Slopes, Economics, Water pressures, Shear resistance.
Identifiers: Failure surfaces, Open pit mining, Kennecot Copper Corp, *Slope stability.

The goal of slope mechanics in open pit mining is to produce efficient and safe slopes and to optimize slopes and minimize stripping by steepening the slopes to their maximum stable limit. The Kennecott Copper Corp established a slope mechanics capability in 1956, and recent work at their Kimberly pit provides a 3-dimensional picture of stability variables. Slope failures can result from rockfalls, rotational shears, block flows, or plane shears. The location, intensity, and orientation of planes of weakness are treated separately because of their influences on slope failure. Kennecott integrates technology into a unified slope mechanics system, balancing effective slope stress and strength. Their approach is to: (1) measure or estimate structure, strength, stress, and ground water; (2) define operating variables as ore profiles, topography and operation design; and (3) successively evaluate the stability of the most economic design slope with a stability model until the overall stability factor is secured. Slope analysis has reached a productive stage in which the cost per ton of ore for an effective program is compensated by potential savings. (USBR)

SONAR TOOL SURVEYS UNDERGROUND CAVITIES,
Prakla Gmbh, Hannover, W. Germany.
Ernest Nolte.
Oil Gas J, Vol 66, No 38, pp 76-78, Sept 1968. 3 p, 3 fig.

Descriptors: *Sonar, Drill holes, Boreholes, Underground structures, *Subsurface investigations, Surveying, *Surveying instruments, Acoustic equipment, Measuring instruments, Instrumentation, Engineering geology, Sonic waves, *Soundings, Cavities, Foundation investigations.
Identifiers: Probes (Instruments), *Underground openings, *Underground cavities, Foreign products, West Germany, Sonic probes, Remote sensing.

A newly developed sonar probe permits complete profiling of underground cavities. The instrument is suspended on a cable, lowered into a borehole, and records horizontal and vertical cross sections for determining the volume and shape of underground cavities. The tool has a rotating and tilting head that overcomes the limitations of horizontally scanning sonar. The head may be rotated 360 deg around the axis and tilted to an angle of 90 deg for upward and downward scanning. Three sonar operating frequencies of 200, 600, and 1000 kc/sec are provided to improve scanning resolution for varying transmission and reflection conditions and distances. The 600-kc/sec frequency is commonly used for measuring distances to 300 ft. Correct depths of the cavity are measured by an electromagnetic detector that uses casing collars as reference points. The probe is 3-1/2 in. in diameter, 12 ft long, and weighs 200 lb. (USBR)

THE RESULTS AND OBJECTIVES OF SOVIET SEISMOLOGY)1917-1967(,
E. F. Savarenskii.
Phys Solid Earth, No 11, pp 721-727, Nov 1967. 7 p.

Descriptors: *Seismology, *Earthquakes, *Seismographs, Foreign design practices, Seismic waves, Geophysics, Seismic investigations, Measuring instruments, Engineering geology, Seismic design instrumentation, Reviews.
Identifiers: Earthquake engineering, Epicenters, Earthquake zones, Earthquake focus, USSR.

The objectives of Soviet seismology are: (1) planning and developing earthquake-proof structures and buildings, (2) researching foreshocks to perfect methods of predicting earthquakes, and (3) investigating the structure of the earth from seismic data. The paper discusses the steady progress of seismology in Russia before and after 1917; during the first 5-yr plans; in the postwar period; in the 1960's; and after the 1966 Tashkent earthquake. The destructive Ashkhabad earthquake in Oct 1948, initiated a period of intensive development to correct certain defects in the national system, such as the accuracy of locating epicenters and establishing the depth of foci. The earthquake demonstrated that earthquake-proof buildings, taking into account the seismic zoning, suffered only slight damage although the tremor reached 10 scale units in certain localities. The author concludes that Russia is approaching the solution of the basic problems of seismology by developing methods to predict earthquakes and design reliable and economical earthquakeproof buildings. DETERMINATION OF THE STRESS IN ROCK UNAFFECTED BY BOREHOLES OR DRIFTS, FROM MEASURED STRAINS OR DEFORMATIONS,
Kyoto Univ., Japan.
Y. Hiramatsu, and Y. Oka.
Int J Rock Mech Mining Sci, Vol 5, No 4, pp 337-353, July 1968. 17 p, 8 fig, 5 tab, 10 ref.

Descriptors: *Stress analysis, *Rock mechanics, *Stress distribution, Stress, Strain, Elasticity, Boreholes, Drill holes, Strain measurement, Strain gages, Drifts, Measuring instruments, Deformation, Subsurface investigations, Tunnels.
Identifiers: Borehole deformation gage, Foreign research, Japan.

Formulae used to quantitatively determine the state of stress in rock unaffected by boreholes or drifts are discussed. Investigations consisted of: (1) measuring variations in borehole diameters, (2) measuring strain on the bottom surface of boreholes, (3) measuring strain on the wall surface of boreholes, (4) measuring variations in boreholes in an oblique dimension, (5) combinations of the above, (6) measuring strains on the walls of drifts or shafts, and (7) using the calibration tests. The study assumed that the ground was perfectly elastic and in a general state of stress, and that the direction of the boreholes or drifts in which measurements were made could be optional. Numerical examples and a discussion of the accuracy of the first 4 procedures indicate that the highest accuracy would be secured using variations in borehole diameters. The least number of boreholes or drifts necessary for each measurement was noted. (USBR)

THE BEARING STRENGTH OF CONCRETE LOADED THROUGH RIGID PLATES,
Sydney Univ, Australia.
N. M. Hawkins.
Mag Concr Res, Vol 20, No 62, pp 31-40, Mar 1968. 10 p, 9 fig, 5 tab, 16 ref.

Descriptors: Concrete, *Concrete testing, Concrete structures, Failure (Mechanics), *Bearing values, *Bearing capacities, *Plates, Strength of materials, Ultimate loads, Eccentric loading, Loading rate, Compressive strength, Load distribution, Bibliographies, Internal friction, Cracks, Cracking.
Identifiers: Concrete properties, Foreign research, *Bearing pressure, *Bearing strength, Australia.

Approximate expressions are developed for bearing strength of concrete members loaded through rigid plates. Ultimate strengths are reported for 18 series of tests in which effects of concentric and eccentric loading, geometry of specimen and loading plate, and type and strength of concrete were evaluated. General expressions for bearing strength are developed on the basis of failure modes observed in the tests. The majority of specimens were 6-in. cubes loaded through 3/4-in.-thick steel plates. Specimens were in direct contact with the platens of a testing machine except during eccentric loading tests when a roller system was inserted between the upper platen and bearing plate. The loading rate was approximately 30 psi/sec. Vertical cracks on the sides of the specimen closest to the loaded area were the first failure warning. Shortly after this warning, the maximum load was reached and a wedge of concrete was punched out from beneath the bearing plate. Simple failure models are proposed for concentric and eccentric loading conditions. Any increase in bearing capacity above the compressive strength of the concrete is directly dependent upon the angle of internal friction; the bearing zone should be dense and air voids and shrinkage cracks minimized. DIRECT DESIGN METHOD FOR PRESTRESSED CONCRETE SLABS,
Catholic University of America, Washington, D C.
Chen-Hwa Wang.
J Prestressed Concr Inst, Vol 13, No 3, pp 62-72, June 1968. 11 p, 5 fig, 6 ref, append.

Descriptors: *Prestressed concrete, Design criteria, Concrete, *Design tools, Design, *Slabs, Concrete structures, Structural design, Moments, Prestressing, Compressive strength, Bending moments, Load distribution, Continuous beams, Supports, Live loads, Dead loads, Reinforced concrete, Reinforcing steel.
Identifiers: Design improvements, Design practices.

A direct design method for prestressed concrete slabs is based on the load-balancing analysis for obtaining the desired minimum or allowable maximum compressive stresses at the extreme fibers of control sections. Control sections should be selected first considering maximum moment and

economy of the entire slab, then behavior of the slab under design load can be predicted. The section with maximum bending moment may be considered as the control section in a simple span. A continuous slab has several maximum moment peaks in the middle portion of spans and over supports. Therefore, selecting the control section depends on the type of structure and engineering judgment. Direct design equations for slabs under uniformly distributed loads are presented and their derivations, based on the load-balancing analysis, are given in the appendix. An 8-step design procedure is illustrated by 3 examples: (1) a one-way 7-1/2-in. roof slab weighing 94 psf and carrying a live load of 75 psf, (2) an 8-in. slab supported on 4 walls to be posttensioned in 2 directions for a live load of 100 psf, and (3) a 7-1/2-in. flat plate weighing 94 psf and carrying a live load of 100 psf. W69-01423

STRENGTH AND ELASTIC PROPERTIES OF CONCRETE IN FLAMING GORGE DAM,
Bureau of Reclamation, Denver, Colo.
K. B. Hickey.
Bur Reclam Rep No C-1139A, July 1968. 23 p, 9 fig, 11 tab.

Descriptors: Concrete, Compressive strength, Poisson ratio, Pozzolans, Concrete control, Elasticity modulus, *Concrete dams, *Concrete testing, Concrete technology, *Mass concrete, Laboratory tests, Concrete mixes, Age, Cores.
Identifiers: *Concrete properties, Flaming Gorge Dam (Utah), Colorado River Storage Project, Longtime tests.

Results of load tests performed at 6 mo and 1, 3, and 5 yr on cores drilled from the mass concrete in Flaming Gorge Dam indicate good concrete in the structure. This study is part of a series in the Bureau of Reclamation's 20-yr evaluation of strength and elastic properties of concrete in various dams. Some findings, based on tests of 142 cores, are: (1) average 5-yr compressive strength of interior concrete, containing approximately 2 sacks of cement and 90 lb of calcined shale pozzolan per cu yd, is 3640 psi (258 kg per sq cm); (2) 5-yr strength of exterior concrete with 3-1/3 sacks of cement per cu yd is 4700 psi (330 kg per sq cm); (3) strengths of both concretes increase slightly with age; (4) average 5-yr compressive modulus of elasticity of the concretes is 4.0 million psi (280 thousand kg per sq cm); and (5) modulus of exterior concrete decreases slightly with age, while modulus of the interior material increases slightly with age. Cement efficiencies, coefficient of variation of strengths, and Poisson's ratios are discussed. (USBR)
W69-01446

RETENTION AND PREVENTION OF FOUNDATION UPLIFT FROM PRESSURE GROUTING,
Resources Agency, Sacramento, Calif.
Robert J. Akers.
Tech Memo No 30, Dep Water Resour, State of Calif, Mar 1968. 8 p, 2 fig.

Descriptors: *Grouting, *Uplift pressures, Displacements, Tiltmeters, Foundations, Extensometers, Strain gages, Instrumentation, Surveying, Cracking, *Dam foundations.
Identifiers: Uplift gages, *Grouting pressure.

Detecting foundation displacement during grouting and determining the pressures involved are important in a successful grouting program. Use of resultant data will permit grouting at the highest safe pressure. Three methods of detecting foundation uplift from excess grouting pressures are: (1) precise leveling surveys, (2) the use of tiltmeters, and (3) the use of displacement gages or extensometers. These methods depend on the assumption that subsurface (foundation) movement will be evident on the surface, or with an extensometer, will cause displacements between the surface and 2-hole reference points. A gage-alarm extensometer-type instrument developed by the Calif State Department of Water Resources is described. Criteria considered were: (1) instantaneous response to displacement, (2) adequate accuracy, (3) audible and visual alarm system actuated by a predetermined displacement, (4) ease of installation, (5) ruggedness and portability, and (6) low cost. (USBR)

8G. Materials

CORROSION AS A PRIMARY CAUSE OF CAST-IRON MAIN BREAKS,
Hinchman Co, Detroit, Mich.
John H. Fitzgerald, III.
Amer Water Works Ass J, Vol 60, No 8, pp 882-897, Aug 1968. 16 p, 10 fig, 35 ref.

Descriptors: *Water pipes, Water supply systems, *Pipelines, Cathodic protection, Pipes, *Cast iron, Corrosion, *Corrosion control, Thickness, Backfills, Metallurgy, Protective coatings, Bibliographies, Electrical resistivity, Direct currents, Costs.
Identifiers: Galvanic corrosion, Underground corrosion, Ductile cast iron, Gray cast iron, *Cast iron pipe, Soil resistivity, Corrosion tests.

The majority of breaks in cast iron water mains occur at locations where the pipe wall has been weakened. Weakening results from graphitic corrosion of cast iron, and although failure may be due to stress, the direct cause is corrosion. The corrosion process is reviewed and data are cited to show the relation between breaks and known corrosion phenomena. Recommendations for corrosion control and reduction of main breaks are discussed. Corrosion control may not pay off in the first 5 to 10 yr; savings from corrosion control are significant in water systems designed to last 100 yr. Eliminating the majority of breaks reduces maintenance expense, traffic delays, and customer ill will. Corrosion control is a management responsibility and is essential to the efficient long-term performance of a piping system. (USBR)
W69-01429

PLASTIC MEMBRANES REPAIR DAMS,
C. F. Groner.
Energy Int, Vol 5, No 8, pp 16-18, Aug 1968. 3 p, 4 fig.

Descriptors: *Impervious membranes, *Repairing, Maintenance, Operation and maintenance, Concrete, Concrete structures, *Concrete dams, Epoxies, Deterioration, Leakage, *Plastics, Membranes, Glass fibers, Bituminous materials, Foreign construction, Materials, Mortars.
Identifiers: Polyesters, Polyvinyl chloride, Norway, Dam facings.

Various polyester and epoxy materials have been used to repair dams in Norway during the last 5 yr. Nomeland Dam, a 28-m high and 140-m long gravity structure, developed substantial leaks, especially along numerous construction joints. Repair operations consisted of cleaning the upstream face with steel brushes and scrapers, patching surface irregularities with cement mortar mixed with polyvinyl chloride, and applying a built-up membrane of polyester and fiberglass fabric. Repairs of an inverted arch concrete intake structure of the Tinfos hydroelectric project are described. The shutdown schedule would not permit complete drying of the concrete, restricting selection of materials to epoxy-type plastics. The membrane material selected (bituminous mortar mixed with epoxy) does not harden into a brittle membrane, remaining reasonably pliable after curing. (USBR)
W69-01434

THEORY AND PRACTICE OF PLASTIC PIPING,
Mooney Brothers Corp., Little Falls, N. J.
Philip A. Schweitzer.
Air Cond, Heat Vent, Vol 65, No 5-9, pp 41-56, 45-51, May-Sept 1968. 23 p, 14 fig, 47 tab.

Descriptors: *Water pipes, Pipe fittings, *Pipelines, *Plastic tubing, Valves, Polyethylenes, Epoxies, *Pipes, *Plastics, Reinforcing, Welding, Thermoplastics, Corrosion, Design criteria, Design data, Materials, Joints, Supports, Asbestos.
Identifiers: Corrosion resistance, *Fiberglass plastic pipes, *Plastic pipes, Reinforced plastics, Glass reinforced plastics.

Plastic piping materials are reviewed to provide information and data on the advantages of the latest plastic piping materials. The review includes: design criteria, pipe dimensions, pipe support, field fabrication and jointing methods, valves, and accessory equipment. Characteristics and design data are discussed for polyvinyl chloride, polyvinyl dichloride, polypropylene, vinylidene fluoride, polyethylene, chlorinated rubber, and fiber-reinforced plastic pipe. Reinforced plastic pipes include glass fiber-reinforced polyester, blue asbestos-reinforced phenolic resin, blue asbestos-reinforced epoxy, and glass fiber-reinforced epoxy. Glass fiber and asbestos are combined with polyester and epoxy to produce piping systems that will withstand high pressures and temperatures. (USBR)

A CATIONIC WATER-BORNE SOIL SEALANT,
Armour Industrial Chemical Co., Chicago, Ill.
Jack N. Dybalski.
Symp New Uses for Asphalt, Amer Chem Soc 156th Annu Meet, Atlantic City, N J, Sept 1968. 13 p.

Descriptors: *Asphalt, Bituminous materials, *Linings, *Canal linings, *Emulsions, Reservoirs, Irrigation canals, Toxicity, *Seepage, Hydraulic structures, Seepage losses, Permeability, Adsorption, Soils, Operation and maintanance, Fish.
Identifiers: *Cationic asphalt emulsions, Surfactants, *Soil sealants, *Underwater canal sealing, Seepage control.

Many materials have been used for lining hydraulic structures, including concrete, asphalt hot mixes, asphalt-based prefabricated panels, buried asphalt membranes, clay, and a variety of plastic and elastomeric films. Each of these materials requires a laborious construction method and a relatively dry, water-free area for installation. These materials are either too costly or involve drying up the structure and time-consuming installation. Such factors point to the need for a waterborne soil sealant which, for speed and convenience, can be added directly to the water to seal the underlying soil. Laboratory and field work during the past 10 yr have shown the superior properties of cationic asphalt emulsions. These properties include a high affinity for almost all surfaces and the ability to strongly adhere to soil particles in the presence of water. Toxicity studies indicate that the sealant is nearly nontoxic by ingestion and nonirritating to ocular and skin tissue. The sealant acts as a physical toxicant to fish by sealing the gills, suggesting a safe method for removing trash fish and snails. (USBR)
W69-01440

LABORATORY AND FIELD INVESTIGATIONS OF PLASTIC FILMS AS CANAL LINING MATERIALS OPEN AND CLOSED CONDUITS SYSTEMS PROGRAM,
Bureau of Reclamation, Denver, Colo.
M. E. Hickey.
Bur Reclam Rep No ChE-82, Sept 1968. 47 p, 5 fig, 14 tab, 16 photo, append.

Descriptors: *Canal linings, Materials, *Buried membranes, *Impervious membranes, Flexible linings, Soil compaction, Vinyl plastics, Laboratory tests, *Polyethylenes, Canal seepage, Subgrade, Irrigation canals, Earth materials, Field investigations, Ponding tests, Cutoffs, *Lower cost canal linings, Plastics.
Identifiers: *Open and Closed Conduit System Project, Seepage control, *Polyvinyl chloride, *Plastic film.

Accelerated laboratory testing and field performance evaluations of polyvinyl chloride (PVC) and polyethylene plastic film indicate that these materials can be used satisfactorily as buried membrane linings. Both materials must be compounded by the manufacturer specifically for canal lining purposes to ensure longtime service. Neither material is suitable as exposed lining and must be protected by a minimum of 1 ft earth cover. Laboratory analysis of PVC lining after 7 yr service and polyethylene lining after 4 yr service indicates no change in these materials. PVC and polyethylene plastic membrane linings in use for 10 yr are giving excellent service. These linings are low cost and easy to install, requiring a minimum of equipment and skilled labor. Short-term laboratory tests on newer ethylene vinyl acetate copolymer and chlorinated polyethylene plastic films indicate that these materials have possibilities as canal linings. Continued testing of these plastics is necessary to ascertain possible advantages over PVC and polyethylene linings. (USBR)
W69-01447

DEVELOPMENT AND USE OF PRESTRESSED STEEL FLEXURAL MEMBERS.

Proc Amer Soc Civ Eng, J Struct Div, Vol 94, No ST9, pp 2033-2060, Sept 1968. 26 p, 12 fig, 55 ref, append.

Descriptors: *Beams, *Prestressing, *Girders, Structural steel, Steel, Safety factors, *Structural members, *Flexural strength, Bibliographies, Composite structures, Bending moments, Tensile stress, Stressing cables, Stess, Stress-strain curves, Trusses, Design criteria, Structural design, Structural engineering.
Identifiers: *Prestressed steel, Hybrid beams, Prestressing systems, Composite beams, I-beams.

Prestressed steel enables the designer to achieve a greater elastic range than is possible for an identical nonprestressed member. This extended range enables a prestressed steel member to resist relatively large overloads without suffering permanent distortion. Prestressing is a means of efficiently utilizing various strength steels in builtup beams or girders, so that significant savings in weight and depth of members can be achieved. Savings are realized without reducing the factor of safety against yielding for any of the steels, but the margin of safety against the plastic mechanism is reduced. (USBR)
W69-01450

EFFECT OF RUST AND SCALE ON THE BOND CHARACTERISTICS OF DEFORMED REINFORCING BARS,
West Virginia Univ., Morgantown; Corps of Engineers, Fort Benning, Ga.
E. L. Kemp, F. S. Brezny, and J. A. Unterspan.
J Amer Concr Inst, V 65, No 9, pp 743-756, Sept 1968. 14 p, 11 fig, 6 tab, 11 ref.

Descriptors: *Reinforced concrete, *Reinforcing steel, *Deformed bars, Reinforcing, *Mill scale, Specifications, Concrete testing, Bars, Design criteria, Materials testing, Concrete, *Concrete technology, Oxidation, Corrosion, Stress.
Identifiers: *Bond tests, Bond strength, Rusting, Test results.

Bond characteristics of ASTM A 432 reinforcing bars were investigated under a wide range of scale and rust conditions. The bar surface condition was the principal parameter studied. Test results indicate that bond characteristics of deformed reinforcing bars meeting ASTM A 305 specifications are not adversely affected by varying degrees of surface rust or ordinary mill scale, provided the bar meets minimum ASTM weight and deformation height requirements. Deformation dimensions appear to govern bond characteristics of rusty bars in that these bars behave similarly to companion as-rolled bars. Current bond requirements seem conservative, especially for smaller bars, because of the 800-psi maximum stress limit. Concrete strength appears to control overall bond behavior, particularly slip and deformation, more than the surface condition of the bar. (USBR)

Descriptors: *Explosions, Explosives, *Excavation, *Cratering, Canals, Craters, Foreign design practices, Mathematical analysis, Design tools, Data reduction, Field data, Design standards, *Charges (Explosives), Rock excavation, Soils.
Identifiers: USSR, *Explosive excavation, Canal construction.

A Soviet research institute, using correlation analysis methods, examined records from actual explosions carried out in the USSR from 1938-1963, to determine the dynamics of excavating charges and to refine design methods of longitudinal structures such as canals. The analysis was limited to explosions having a single-row placement of charges at depth to 20 m in 3 classes of soils: sandy clays and gravels; clays; and rocks such as limestones, sandstones, and slates. Results showed that: (1) M M Boreskov's formula for determining charge weight is justified for cratering factors (n) from 1 to 3; (2) this formula is accurate for row charges in channel excavation when n = 2 to 3, without a correction factor; (3) this factor, based on relations established by the analysis between various parameters in the formula, allows computing row-charge explosive excavation for channels when n ranges from 1 to 3; (4) the experimental study of geometric shapes and dimensions of craters determined the differences between true and apparent craters and made possible the development of a formula for computing the apparent depth of excavation; and (5) best results were obtained by using charges with n equal to or greater than 2.5. WATER RESOURCES RESEARCH INTERESTS IN THE SENIOR COLLEGES AND UNIVERSITIES OF NORTH CAROLINA.
North Carolina University, Chapel Hill.

Water Resour Res Inst Rep 3, Univ N Car, Apr 1967. 22 p. OWRR Project A-999-NC.

Descriptors: *Water resources, Water Resources Research Act, Grants, Manpower, Universities, North Carolina, Research facilities, *Scientific personnel.

The water resources research interests of faculty members of the senior colleges and universities of North Carolina are summarized. Many of the scientists listed in this report, while presently devoting their full attention to nonwater related research, have indicated sufficient interest in water resources to suggest their possible involvement in this field. This represents a reservoir of potential research capability which can be drawn upon as circumstances permit.

WATER RESOURCES CENTER)GA. INST. OF TECHNOLOGY(.
State of Georgia, Atlanta.

17 Ga Code Ann, Secs 17-401 to 17-403 (1967).

Descriptors: *Georgia, Legislation, *United States Research development, Training, *Water resources, *Universities, Local governments, Contracts, Grants, Inter-agency cooperation.
Identifiers: Georgia Institute of Technology.

The Georgia Institute of Technology is empowered to operate a center for research and training in relation to water and resources affecting water. The findings and recommendations arising from such research are to be published or otherwise made available. The Center is authorized to use federal funds made available by grants and to use matching federal funds for expenses of specific water resources research projects. The center can enter into contracts or agreements with other colleges or universities, the federal government, local government units of this state and other individuals for specific research relating to water problems. 9D. Grants, Contracts, AND Research Act Allotments

FEDERAL GRANTS FOR CLEAN WATER.

Fed Water Pollut Contr Admin Publ CWA-6, Ja 1968. 12 p.

Descriptors: *Grants, Research and development, *Contracts, Planning, *Water pollution control, Legislation, Application methods, Water resource development.
Identifiers: *Federal Water Poll Cont Act, *Research and dvlpmt centers, *Clean Water Restoration Act.

Each of the grant programs administered by the Federal Water Pollution Control Administration described in this booklet. The purpose, financial basis, method of distribution, matching provision, who may receive federal aid, application procedure and legal basis is given for each of the following grant programs: (1) Grants for comprehensive basin planning, (2) Training grants and research fellowships, (3) Research, development and demonstration grants and contracts, (4) State and interstate agency program grants, (5) Grants for waste treatment works construction, and (6) Appalachian regional development grants for waste treatment works construction. ANNUAL REPORTS OF THE CUMBERLAND RIVER BOARD, THE NORTHUMBERLAND AND TYNESIDE RIVER BOARD, AND THE WEAR AND TEES RIVER BOARD FOR THE YEAR ENDED 31ST MARCH, 1964.
Cumberland River Board, the Northumberland and Tyneside River Board and the Wear and Tees River Board.

90 pp, 15 graphs, 8 tables, 3 plates; 58 pp, 2 gr; pp, 4 pl, 1 map.

Descriptors: *Storm runoff, *Water pollution, *Waste dilution, Standards, *Overflow.

These reports contain information on water resources, fisheries, and prevention of pollution, including the quality of water and sources of pol

tion in individual rivers; standards for effluents from sewage works, storm-sewage tanks and overflows, individual properties, farms, and trade premises. In the Wear and Tees area, serious pollution, with obvious pollution by crude sewage, was observed in a small stream following a heavy storm, showing that overflows of storm-sewage are not adequately diluted by the increasing flow of the receiving stream when the stream is small and the storm-sewage overflow setting is low.
W69-01508

TWELTH AND THIRTEENTH ANNUAL REPORTS BEING FOR THE YEARS ENDED 31ST MARCH, 1963 AND 31ST MARCH, 1964.
Lancashire River Board.

102 pp and 106 p respectively.

Descriptors: *Storm runoff, *Overflow, *Water pollution.
Identifiers: *Storage tanks, *Urban drainage.

These reports contain information on water resources and the prevention of river pollution, both of which were affected by the severe cold weather early in 1963. One of the principal problems in the industrialized parts of the area is the pollution caused by storm sewage overflows, and to alleviate pollution caused by the 'first flush' of storm sewage overflows the Board has suggested the provisions of holding tanks. An investigation was begun into the factors causing growth of Sphaerotilus natans in a river below the outfall from a paper mill where suspended solids content and BOD of the effluent are vary low. Other special investigations included studies on the Wyre estuary to determine the composition and rate of discharge of effluents which could be considered unlikely to harm migratory fish. The criteria used in assessing the degree of pollution of a river or stream are summarized.
W69-01509

TWELFTH AND THIRTEENTH STATUTORY ANNUAL REPORTS, YEARS ENDED 31ST MARCH, 1963 AND 31ST MARCH, 1964.
Trent River Board.

116 pp, 2 maps, 6 plates.

Descriptors: *Water pollution, *Storm runoff, *Overflow, Surface runoff.
Identifiers: *Storm sewers, *Suspended solids.

These reports of the Trent River Board contain sections on water resources, fisheries, and prevention of river pollution, including information on water quality (which is interpreted in relation to the discharge of polluting waste waters and the effects of severe cold weather); remedial action; and standards for effluents. Chemical data obtained in river surveys are appended and are correlated with biological characteristics as represented by the Biotic Index. The principal cause of fish mortalities was de-oxygenation of river water due to prolonged ice and snow cover or to the operation of storm-sewage overflows following periods of dry weather; the first flush of water discharged from surface-water sewers after a dry period is also highly polluting and contributes to de-oxygenation. During the first few days of April each year the rivers Tame and Trent carry in suspension large quantities of detached sewage fungus which, under conditions of low flow, settle out with other suspended matter and tend to become black in colour; following rainfall and increased flow in the rivers, this material is scoured out into suspension and exerts a considerable oxygen demand thus contributing further to the de-oxygenation. The cold winter of 1963 inhibited nitrification at most of the sewage works; this caused increased concentrations of ammonia in the receiving waters at a period when flow was minimal and the frozen surface of the rivers prevented aeration, and is considered to be the cause of elimination of fish in a stretch of the river Soar. Prevention of Pollution By-laws became operative in November 1962.

10. SCIENTIFIC AND TECHNICAL INFORMATION

WATER RESOURCES OF VIRGINIA: AN INVENTORY OF PRINTED INFORMATION AND DATA,
Virginia Polytechnic Institute, Blacksburg.
Frederick E. McJunkin, and William R. Walker.
Water Resources Res Center Rep, Virginia Polytech Inst, Mar 1966. 109 p, 1,010 ref, append.
OWRR Project A-999-Va.

Descriptors: *Bibliographies, Water resources, Water resources research act, Water resources development, Virginia, Publications, Technology, Research and development.
Identifiers: Inventories, Technical papers, Reports.

An inventory of published information and data on the general subject of water resources in Virginia. The publication is divided into 2 basic indexes: an author index and a subject and geographic index. Publications prepared for an agency but listing individual authors have been listed under the author index. Papers prepared for agencies which do not identify the author are indexed according to agency name. Listing of authors and subjects is alphabetical. Where one author has several listings, these are chronologically ordered with a few exceptions, e.g. U S Army Corps of Engineers, wherein ordering is alphabetical by the name of the body of water concerned. An appendix enumerates addresses of state and federal government organizations concerned with research, planning, development, and use of water or water related resources in Virginia. The principal coverage has been limited largely to materials dealing wholly or in part with aspects of water resources with specific reference, geographical or otherwise, to Virginia. Some listings from related fields are also included.

PRECIPITATION(ATMOSPHERIC)
WATER REQUIREMENTS FOR INCREASED ARID LAND PRODUCTIVITY,
W69-01470 02D

PRESCRIPTIVE RIGHTS
TOWN OF MOULTONBORO V BISSONNETTE (BOATHOUSE ON PUBLIC RIPARIAN LAND).
W69-01357 06E

PRESSURE DISTRIBUTION
STRESSES AGAINST UNDERGROUND STRUCTURAL CYLINDERS,
W69-01421 08A

PRESTRESSED CONCRETE
DIRECT DESIGN METHOD FOR PRESTRESSED CONCRETE SLABS,
W69-01423 08F

PRESTRESSED STEEL
DEVELOPMENT AND USE OF PRESTRESSED STEEL FLEXURAL MEMBERS.
W69-01450 08G

PRESTRESSING
DEVELOPMENT AND USE OF PRESTRESSED STEEL FLEXURAL MEMBERS.
W69-01450 08G

PRIMARY PRODUCTIVITY
STANDARD CORRELATIONS BETWEEN PELAGIC PHOTOSYNTHESIS AND LIGHT,
W69-01458 02H

PRIOR APPROPRIATION
PROBLEMS ARISING OUT OF MONTANA'S LAW OF WATER RIGHTS,
W69-01233 06E

PRODUCTIVITY
PRODUCTIVE CAPACITY OF NORTH AMERICAN LAKES AS RELATED TO THE QUANTITY AND TROPHIC LEVEL OF FISH, THE LAKE DIMENSIONS AND THE WATER CHEMISTRY,
W69-01398 02H

PRODUCTION RATE, POPULATION DENSITY, AND DRIFT OF A STREAM INVERTEBRATE,
W69-01430 05C

SOIL MOISTURE AND TEMPERATURE CHANGES FOLLOWING SAGEBRUSH CONTROL,
W69-01469 03B

PROJECT PLANNING
THE GALVESTON WORK PLAN,
W69-01404 06B

PROTECTION(ELECTRICAL)
INSULATION CO-ORDINATION IN EHV SYSTEMS WITH LOW INSULATIO LEVELS --A SURGE DIVERTER PROBLEM,
W69-01426 08C

PUBLIC BENEFITS
EVALUATION-DETERMINATION AND INTEGRATION OF INDIVIDUAL AND SOCIAL VALUES--FOCUS OF PUBLIC POLICY.
W69-01272 06B

PUBLIC HEALTH
CITY OF UTICA V WATER POLLUTION CONTROL BD (AUTHORITY OF WATER POLLUTION CONTROL BOARD).
W69-01322 05G

PUBLIC HEARINGS
AN ACT...TO CHANGE THE DEFINITION OF WATERS..., TO CHANGE THE DEFINITION OF POLLUTION, TO EXEMPT TIDAL WATERS..., CERTAIN DRAINAGE SYSTEMS FROM THE PERMIT REQUIREMENTS.
W69-01306 04A

PUBLIC LANDS
TOWN OF MOULTONBORO V BISSONNETTE (BOATHOUSE ON PUBLIC RIPARIAN LAND).
W69-01357 06E

PUBLIC RIGHTS
UNCERTAINTY IN WASHINGTON WATER RIGHTS,
W69-01261 06E

BURKHART V CITY OF FT LAUDERDALE (RIPARIAN RIGHTS -- INGR AND EGRESS).
W69-01353 06E

MOUNTAIN SPRINGS ASS'N V WILSON (EASEMENT OF USE AND

ENJOYMENT OF STREAM).
W69-01356 06E

PUBLIC UTILITIES
IMPACT AND INCIDENCE OF TAXATION ON WATER UTILITIES IN RHODE ISLAND,
W69-01258 06C

PUMP TURBINES
THE SENECA PUMPED-STORAGE PLANT,
W69-01454 08C

PUMPED STORAGE
THE SENECA PUMPED-STORAGE PLANT,
W69-01454 08C

PUMPING
THE EFFECT OF PUMPING OVER AN AREA,
W69-01415 04B

IMPROVEMENTS TO SEWAGE TREATMENT AT BATH.
W69-01541 05D

RAINFALL AT NEW ORLEANS AND ITS REMOVAL,
W69-01568 04A

PUMPING PLANTS
OPTIMUM PENSTOCK DIAMETER FOR HYDROELECTRIC POWERPLANTS AND PUMPING PLANTS,
W69-01431 06B

RADIATION MEASUREMENT
A SINGLE-WELL METHOD FOR DETERMINING THE DIRECTION AND VELOCITY OF FLOW OF UNDERGROUND WATERS--RESULTS OF IN-THE-FIELD INVESTIGATIONS,
W69-01411 07B

RADIO INTERFERENCE
STUDY OF OVERHEAD GROUND WIRES FOR DC TRANSMISSION LINES,
W69-01432 08C

RADIOACTIVE ISOTOPES
A SINGLE-WELL METHOD FOR DETERMINING THE DIRECTION AND VELOCITY OF FLOW OF UNDERGROUND WATERS--RESULTS OF IN-THE-FIELD INVESTIGATIONS,
W69-01411 07B

RADIOISOTOPES
ANALYSIS OF NATURAL RADIOELEMENTS IN RAW WATER,
W69-01256 05A

LABORATORY EVALUATION OF SELECTED RADIOISOTOPES AS GROUND-WATER TRACERS,
W69-01491 02F

RAIN
EFFECT OF SNOW COMPACTION ON RUNOFF FROM RAIN OR SNOW,
W69-01578 02C

RAIN GAGES
RAINFALL-RUN-OFF RELATIONS IN THE UPPER GOULBURN RIVER CATCHMENT, N.S.W.,
W69-01583 02A

RAIN WATER
THE QUALITY OF STORM WEATHER FLOW,

VOLUME 2, NUMBER 5
MARCH 1, 1969

MAY -2 1969
UNIVERSITY

WR 69-01594 -- WR 69-02000

NEW SERIES

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign); single copy price is $3.00.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 2, NUMBER 5
MARCH 1, 1969

WR 69-01594 -- WR 69-02000

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

COMPENDIUM OF MAJOR INTERNATIONAL RIVERS IN THE ECAFE REGION.
nited Nations, Economic Comm for Asia and the ast, Bankok, Thailand. Div of Water Resources ev.

/ater Resources Series No 29, 75 p, 1966. 11 fig, 1 ppend, 28 ref.

escriptors: *International waters, *Data collecon, *Rivers, *Hydrologic data, River basin evelopment, Flood control, Hydroelectric power, /ater supply, Irrigation, Navigation.
entifiers: *Asia, *International rivers, Mekong, ed, Brahmaputra, Meghna, Ganges, Kosi, Gank, Gogra, Sutlej, Indus, Kabul, Helmand.

asic data are compiled for the major rivers of the ea of the Economic Commission for Asia and the ar East (United Nations). The 12 river systems overed in the compilation are the Mekong, Red, rahmaputra, Meghna, Ganges, Kosi, Gandak, ogra, Sutlej, Indus, Kabul, and Helmand. The inrmation compiled includes basic data on physical atures, hydrology, meteorology, completed procts, and planned development projects. All the vers have great potential for development of ater supplies, irrigation, power, and navigation. ney all have severe flood damage potential that ust be controlled for full development of their sins. Whenever severe floods occur in the Brahaputra and the Ganges, for example, hundreds d even thousands of lives are lost, millions are ade homeless, and crops and property damages e so great as to affect the economies of the counes as a whole. ECAFE as an international ornization can offer services to help bring about operation among riparian countries for developent projects such as the Mekong and Indus procts. (Lang-USGS)

escriptors: *Statistical models, *Hydrology, Mathematical studies, Statistics, Synthesis, Time ries analysis, Fourier analysis, Markov processes.
entifiers: Self-similar statistical models.

he use of 'self-similar' models in statistical drology appear very promising in treating the oah effect,' the observation that extreme precipitation tends to be very extreme, and the 'Joseph effect,' the observation that long periods of unusual high or low precipitation tend to be very long. Current models of statistical hydrology cannot account for either effect. Self-similarity, a statistical means of accounting for after-effects, is used to attempt to account for the empirical observations of Harold E Hurst on long term hydrological trends. The applicability of self-similar statistical models to long term hydrological records is discussed and summarized. (Knapp-USGS)

BASE-FLOW RECESSIONS--A REVIEW,
New Hampshire Univ., Durham.
Francis R. Hall.
Water Resources Res, Vol 4, No 5, pp 973-983, Oct 1968. 11 p, 111 ref.

Descriptors: *Recession curves, *Base flow, *Surface-groundwater relationships, Hydrograph analysis, Mathematical studies, Statistical methods.
Identifiers: Drainage basin characteristics.

The literature of base flow recession is reviewed and discussed with emphasis given to the problems and needs of current methods of study. By the early nineteen hundreds much of the basic mathematical development was completed, and some methods of hydrograph analysis were known. Recent mathematical work, although somewhat repetitive of earlier work, assesses more closely the effects of the simplifying assumptions used to obtain solutions. Most workers have preferred to follow graphical or statistical rather than mathematical approaches. The reasons appear to lie mainly in problems caused by the assumptions and in difficulties in interpreting the real stream hydrograph. Also, base flow can come from numerous sources besides ground water. Other complications arise from the question of whether the basin response is linear or nonlinear, because the response is a function of various geologic and hydrologic factors in addition to those considered in the mathematical derivations. (Knapp-USGS)
W69-01611

STATISTICAL PROPERTIES OF STREAM LENGTHS,
IBM Watson Research Center, Yorktown Heights, New York.
J. S. Smart.
Water Resources Res, Vol 4, No 5, pp 1001-1014, Oct 1968. 15 p, 8 fig, 4 tab, 17 ref.

Descriptors: *Geomorphology, *Hydrogeology, *Drainage patterns (Geologic), *Terrain analysis, Drainage density, Statistical methods, Mathematical models.
Identifiers: *Drainage basin characteristics, Stream lengths, Horton analysis, Stream numbers.

A statistical treatment of drainage basin geometry is presented and discussed. Two basic assumptions are employed in this treatment of the statistics of stream lengths: (1) All topologically distinct networks with a given number of sources are equally likely (after Shreve); (2) Lengths of interior links in a given network are independent random variables drawn from the same population. The mathematical development leads to an approximate expression for the mean length of streams of order that contains no adjustable parameters and that depends only on the stream numbers and the mean link length. This expression gives somewhat better agreement with data on actual stream systems than does Horton's law of stream lengths; other advantages over Horton's law are cited. Quantitatively, our procedure appears to account for about 65% of the variance in mean stream length data for third- and fourth-order basins. If exact values of the link numbers are introduced into the calculation, the unexplained variance is reduced to about 15%. For a complete statistical description of stream lengths, it is necessary to know the distribution of interior link lengths. Results of computer simulation studies suggest that this distribution is negative exponential. Data taken on two small watersheds (140 links) show reasonable agreement with this hypothesis.

HORTON'S LAWS OF STREAM LENGTHS AND DRAINAGE AREAS,
U. S. Geological Survey, Washington, D. C.
Adrian E. Scheidegger.
Water Resources Res, Vol 4, No 5, pp 1015-1021, Oct 1968. 7 p, 1 fig, 5 tab, 11 ref.

Descriptors: *Geomorphology, *Hydrogeology, *Drainage patterns (Geologic), *Streams, *Terrain analysis, Channels, Drainage density, Statistical methods, Mathematical models, Synthetic hydrology.
Identifiers: Drainage basin characteristics, Horton analysis, Stream lengths, Stream numbers, Stream orders, Drainage areas.

Horton's metric laws of stream lengths and drainage areas are examined and the validity of the concept of cycles or generations of rivers is questioned. The usual explanation of such cycles depends upon some topological features in river basins that do not seem to occur in nature. The most serious objection is that many actual stream networks are not structurally Hortonian or self-similar; that is, subnets of one generation are not necessarily topologically similar to those of other generations. It seems more likely that stream networks more closely resemble mathematical bifurcating arborescences in which the probability of branching is the same in any segement. Such networks rationally explain Horton's laws of stream lengths and drainage areas without any specific structural assumptions regarding river nets and without recourse to theories of cyclic basin development. (Knapp-USGS)

MINIMUM FLOW OF SMALL RIVERS IN THE ASIATIC USSR,
A. M. Vladimirov.
Translated from Trudy Gos Gidrol Inst No 139, 1967. pp 4-23. Soviet Hydrol, Selec Pap No 1, pp 1-16, 1967. 16 p, 5 fig, 3 tab, 50 ref.

Descriptors: *Base flow, *Surface-groundwater relationships, *Estimating, *Statistical methods, *Runoff forecasting, Discharge (Water), Geomorphology, Hydrogeology, Permafrost.
Identifiers: Asiatic USSR, Curve fitting, Hydrological estimation, Small rivers.

Because gaging stations are few and widely scattered in Asiatic USSR, methods for computing baseflow of small rivers by using regional hydrological parameters were developed. Graphs of the relationship between low flow and drainage basin area were plotted for 69 regions with different geomorphological and hydrogeological structures, using a 1:5,000,000 hydrogeological map. The relationship of minimum 30-day runoff (M) to basin area (F) is of the form M-F to the power n throughout most of Asiatic USSR. Base flow (Q-min) was related to the other parameters by the relation Qmin=a (F to the power n). The relation was calculated for rivers in both the warm and cold seasons. Intermittent streams were described by the relation Qmin=a ((F-C) to the power n) where C=the average area of the basin which contributes no flow. Values of the parameters for the 69 regions are tabulated. Streams in permafrost areas differ somewhat because water is stored in ice in cold weather and released in summer. The deviation of actual flow from predicted flow is 10-25% in regions with plentiful gaging data, and as high as 30% in areas with scanty data. (Knapp-USGS)
W69-01626

SMALL WATERSHED STORAGE USING LOW DAMS,
Massachusetts Univ, Amherst, Dep of Civil Engineering.
Karl N. Hendrickson.

Mass Univ, Water Resources Res Center, Symp Proc, Publication No 3, pp 141-152, June 2, 1967. 13 p, 1 map, 2 graph, 9 ref.

Descriptors: *Small watersheds, *Dam, Water management (Applied), *Design, *Project planning, Reservoir operation, Watershed management, Flood control, Water supply, Infiltration, Base flow.
Identifiers: Low dam system.

The literature of design criteria and cost-benefit analysis for construction of dams on small watersheds is reviewed and condensed for the use of local water administrators. The principles of hydrology are briefly reviewed. A detailed procedure for management and design is given. An example of a small watershed impoundment owned by the Amherst Water Board is analyzed, and the data used and the design and management decisions made are summarized. (Knapp-USGS)
W69-01636

ATMOSPHERIC CONTRIBUTIONS TO WATER QUALITY OF STREAMS IN THE HUBBARD BROOK EXPERIMENTAL FOREST, NEW HAMPSHIRE,
U. S. Geological Survey and Sears, Roebuck and Co., Chicago, Illinois, and Dartmouth College, Hanover, New Hampshire.
D. W. Fisher, A. W. Gambell, and G. E. Likens.
Water Resources Res, Vol 4, No 5, pp 1115-1126, Oct 1968. 12 p, 4 fig, 5 tab, 15 ref.

Descriptors: *Dissolved solids, *Runoff, *Precipitation (Atmospheric), Aluminum, Sulfates, Nitrates, Silica, Hydrogen ion concentration, New Hampshire.
Identifiers: Hubbard Brook Experimental Forest (New Hampshire).

The relationships between precipitation, stream discharge, and concentrations of mineral constituents of 3 tributaries of Hubbard Brook, New Hampshire, were studied. Hydrologic data and chemical analyses of precipitation and stream water were collected over a 2 yr period. It was found that precipitation supplies most of the 30-50 kg per hectare of sulfate. Input of ammonium and nitrate to the streams exceed discharge of these ions from the basin. Maximum nitrate concentrations are 2 mg/l and occur in early spring. Hydrogen ion is one of the major cations in precipitation. Bicarbonate and silica vary directly with each other and inversely with alumina. Silica discharge ranged from 20-40 kg/hectare. (Knapp-USGS)
W69-01644

PROGRESS REPORT (STUDY OF RATIONAL METHOD),
John C. Schaake, Jr.
Progress Report of the Storm Drainage Research Project, Johns Hopkins University - Report No XI.

Descriptors: *Rainfall intensity, *Storm runoff, Storm drainage.
Identifiers: *Urban drainage, *Calculations.

The observations of 19 gaged urban drainage areas was used to verify or study the Rational Method. The concentration time used was the center of mass of the rainfall hyetograph and the runoff hydrograph. The C-factor was determined by plotting frequency distributions of observed rainfall intensities and peak runoff rates on logarithmic probability paper. Equations for concentration time and 'C' factor are given provided the drainage area has certain characteristics.

A LEAST-SQUARES HYDROGRAPH ANALYSIS OF COMPLEX STORMS ON SMALL AGRICULTURAL WATERSHEDS,
Agr. Research Service, Hydrograph Lab., Beltsville, Maryland.
D. E. Overton.
Water Resources Res, Vol 4, No 5, pp 955-963, Oct 1968. 9 p, 8 fig, 2 tab, 13 ref.

Descriptors: *Unit hydrographs, *Hydrograph analysis, *Synthesis, *Storm runoff, Rainfall, Streamflow forecasting, Regression analysis, Demonstration watersheds, Maryland.
Identifiers: *Least-squares hydrograph, Storm hydrograph.

The feasibility of using a least-squares technique to extract unit hydrographs from data of complex storms on small agricultural watersheds was investigated. The procedure is the reverse of hydrograph synthesis. Rather than summing unit hydrographs to synthesize a complex storm, the unit hydrograph was calculated. The feasibility of the technique was clearly shown on four of the five Agricultural Research Service watersheds in the study. Large perturbations occurred in the calculated unit hydrographs on one of the watersheds, but reasonable results were obtained on the remaining four. The calculated unit hydrographs varied from storm to as expected. The results of these analyses demonstrate the feasibility of the least-squares technique as a means of analyzing al storm hydrographs on small agricultura watersheds to detect the nonlinearity of the rain fall-runoff process. ADJUSTMENT OF RADAR ESTIMATES OF STORM MEAN RAINFALL WITH RAIN GAGE DATA,
F. A. Huff.
J Applied Meteorology, Vol 6, No 1, pp 52-6 1967.

Descriptors: *Rain gages, *Rainfall intensity Storms.
Identifiers: *Radar measurement.

Evaluation of feasibility of using surface rain gag data to modify radar-rainfall equation for specifi storm conditions; data used were for 19 storms, an study was restricted to warm-season, unstabl precipitation and to use of 10-cm radar; normal cl matic network was found inadequate for modifica tion, for area and conditions studied, if relative accurate estimate is needed; however, correspon dence of radar and rain gage patterns was muc better with 10-cm radar than it had been with 3-c radar.
W69-01673

A TIME INTERVAL DISTRIBUTION FOR EXCESSIVE RAINFALL,
H. C. S. Thom.
ASCE Proc, J of Hydr Div, Vol 85, No HY7, p 8 1959.

Descriptors: Rainfall intensity, *Sewers, *Design.

The methods usually used for frequency analysis excessive precipitation average the recurrence i tervals and thus obscure much useful informatio for the design of sewerage systems. Additional i formation can be obtained however by relati probability to recurrence interval instead of rainfa depth, thus giving the distribution of recurrence i terval for a predetermined amount of rainfall.
W69-01898

CITY OF OAKLAND DEVELOPS NEW RAINFALL INTENSITY-DURATION CURVES,
D. M. Winton.
Pub Works, Vol 90, No 7, p 120, 1960.

Descriptors: *Rainfall intensity, Design.
Identifiers: *Storm sewers, *Calculations, Oakla (Calif).

Based on a report compiled by Fites, L. A., t author gives a brief account, with tables a graphs, of the 1958 rainfall intensity-durati curves now being used in the city of Oaklan Calif., for the design of storm sewers.

W69-01914

SPATIAL DISTRIBUTION OF HEAVY STORM RAINFALLS IN ILLINOIS,
F. A. Huff.
Water Resources Res, Vol 4, No 1, pp 47-54, Feb 1968.

Descriptors: *Storms, Rainfall intensity.
Identifiers: *Calculations, Illinois.

An 11-year continuous record from 49 recording rain gages on 400 square miles in central Illinois has been used to derive characteristic area-depth relations in heavy rainstorms for storm periods of 30 minutes to 48 hours on areas of 50, 100, 200, and 400 square miles. First, eight general equations were statistically tested to determine the most appropriate fitting method for the area-depth curve. Over-all, an equation relating rainfall depth to the square root of the area received the highest score. However, the equation that fit best was found to vary with areal size, mean rainfall, and storm duration, which, in turn, reflected general trends in relative variability and skewness of the rainfall spatial distribution. Because of the high degree of variability in the area-depth relation between storms, the analytical results have been presented as probability distributions for given sets of conditions with respect to area, storm duration, and rainfall volume. Thus, the user is provided with both average curves and curves applicable to more extreme patterns of storm rainfall.
W69-01915

TIME DISTRIBUTION OF RAINFALL IN HEAVY STORMS,
F. A. Huff.
Water Resources Res, Vol 3, No 4, p 1007, 1967.

Descriptors: *Storms, Rainfall intensity.
Identifiers: *Calculations, Illinois.

Time distribution relations have been developed for heavy storms on areas ranging up to 400 square miles and presented in probability terms to provide quantitative information on interstorm variability and to provide average and extreme relations for various applications of the findings. It was found that the relations could be represented best by relating per cent of storm rainfall to per cent of total storm time and grouping the data according to the quartile in which rainfall was heaviest. The individual effects of mean rainfall, storm duration, and other storm factors were small and erratic in behavior when the foregoing analytical technique was used. Basin area had a small but consistent effect upon the time distribution. The derived relations are applicable to the Midwest and other areas of similar climate and topography. They can be used in conjunction with published information on spatial distributions and other storm parameters to construct storm models for hydrologic applications.
W69-01916

2C. Snow, Ice, AND Frost

SNOWMELT AT AN INDEX PLOT,
New Brunswick Univ., Fredericton, N. B., Canada.
W. W. Pysklywec, K. S. Davar, and D. I. Bray.
Water Resources Res, Vol 4, No 5, pp 937-946, Oct. 1968. 8 p, 5 fig, 1 tab, 7 ref.

Descriptors: *Snowmelt, *Runoff forecasting, Heat budget, *Regression analysis, Water yield, Meteorological data.
Identifiers: Canada, New Brunswick, Snowmelt index plot.

A large experimental index plot was installed in an open area near a climatological station in the North Ashwaaksis Stream Basin, N B, to obtain data for relation between snowmelt measured at the plot and regional meteorological parameters related to the snowmelt process. The data collected during the 1966 spring snowmelt season were analyzed by the degree-day method, the U S Corps of Engineers generalized snowmelt equations, and optimal regression equations derived from the measured snowmelt at the index plot and related thermal budget indices calculated using individual meteorological parameters. The methods gave generally comparable results; their specific merits and limitations are discussed. The deviation of seasonal totals by the three methods varied from -15.6 to +54.5%. The relative accuracy of the three techniques as daily predictors compared by taking the root-mean-squared values of the deviations of daily estimated snowmelt from the daily measured values ranged from 0.17 to 0.22 in. It is suggested that experimental index snowmelt plots and optimal regression equations may enable dependable prediction of point snowmelt rates to use for estimation of basin-wide snowmelt and hydrograph synthesis. (Knapp-USGS)

PRINCIPAL HEIGHT ZONES OF STREAMFLOW FORMATION IN CENTRAL ASIA IN DIFFERENT MONTHS OF THE GROWING SEASON,
T. S. Abal'yan.
Soviet Hydrol, Selec Pap No 1, pp 72-81, 1967. 10 p, 2 fig, 3 tab, 17 ref.

Descriptors: *Streamflow forecasting, *Snow surveys, *Snowmelt, Runoff forecasting, Water supply, Synoptic analysis, Hydrologic properties, Meteorological data.
Identifiers: USSR, Central Asia, Streamflow formation.

The altitude zones providing meltwater runoff for each month in the growing season of central Asia, USSR, were determined by multiple correlation analysis of runoff and snow survey data. Streamflow forecasting in Central Asia, which has extremely uneven climatic, hydrologic, and other physiographic characteristics, is possible with the assumption that climatic variation in the mountains has a well defined pattern related to altitude. Regression analysis is used to determine whether the character of variation of snowpack with altitude, heat flux distribution and precipitation vary between drainage basins in a region. Monthly discharge data for 43 rivers in Central Asia were collected and tabulated, monthly discharges were correlated with the areas of altitude zones where snowmelt occurs each month and the results were tabulated. Runoff and elevations were plotted and interpretation of the graph provides the amount of runoff for each altitude zone. The analysis facilitates streamflow forecasting by snow surveying. (Knapp-USGS)
W69-01601

METHOD OF FORECASTING ICE PHENOMENA IN RIVERS,
Hydrometeorological Scientific Research Center, USSR.
N. A. Bagrov, and A. P. Kukhto.
Trans. from Meteorol i Gidrol, No 2, 1967, pp 22-28. Soviet Hydrol, Selec Pap No 1, pp 97-102, 1967. 6 p, 1 fig, 2 tab, 5 ref.

Descriptors: *Freezing, *Rivers, *Forecasting, *Synoptic analysis, Climatology, Charts, Meteorology, Regions, Regression analysis.
Identifiers: *Ice phenomena, USSR.

Methods for predicting freezing of rivers in the USSR using atmospheric circulation and thermal budget data over very broad regions are discussed. Because initial autumn heat contents of rivers are much less variable than cooling-season weather, dates of ice formation are determined chiefly by the cooling history of the water. Multiple regression analysis is used to determine the effectiveness of predictors chosen by techniques of synoptic analysis in predicting data of freezing. (Knapp-USGS)
W69-01602

DISTRIBUTION OF THE WEIGHT OF SNOW COVER IN THE USSR,
V. I. Kipovskaya.
Translation from Gl Geofiz Observ No 210, 1967. pp 68-78. Soviet Hydrol, Selec Pap No 1, pp 63-72, 1967. 10 p, 5 fig, 5 tab, 7 ref.

Descriptors: *Snow cover, *Snow surveys, *Water equivalent, Synoptic analysis, Data collections, Frequency, Maps, Meteorological data.
Identifiers: USSR, Snow accumulation, Applied climatology.

Snow survey data for the USSR from 1936 to 1960 from 700 stations were analyzed for water equivalent and snow depth. Maps of the water equivalent of snow accumulations of 50, 20, 10, and 5% probability were compiled. The water equivalent of snow varies greatly in the USSR. The highest coefficients of variation are in the Ukraine (0.51), Belorussia (0.57), the Baltic States (0.60), Maritime Province (0.57), and Krasnodar Province (0.71), all areas of unstable snow cover; the lowest are in areas of stable accumulation. Water equivalents are higher in forested than in open areas. (Knapp-USGS)
W69-01631

2D. Evaporation and Transpiration

PATTERNS OF THE THERMAL REGIME OF THE SURFACE LAYER OF WATER,
M. P. Timofeyev, and S. P. Malevskiy-Malevich.
Translation from Meteorol i Gidrol, No 2, 1967, pp 57-65. Soviet Hydrol, Selec Pap No 1, pp 102-109, 1967. 8 p, 2 fig, 6 tab, 14 ref.

Descriptors: *Air-Water interfaces, *Heat budget, *Heat transfer, *Thermal stratification, *Bodies of water, Evaporation, Convection, Radiation, Winds, Waves (Water).
Identifiers: *Heat exchange, *Thermal regime, USSR, Lake Baikal, Lake Sevan.

The processes of heat exchange between water surface and overlying air are reviewed and examples calculated for Lake Baikal, the North Atlantic Ocean, Lake Sevan, and an evaporation pan. Results of measurements of the water temperature at various depth, wave height, wind velocity, air temperature, and radiation balance were compared with calculated values. The main forms of heat exchange between the water surface and the atmosphere are known to be turbulent exchange of sensible heat, radiation, and heat exchange associated with phase changes of water (mainly evaporation). These forms of heat exchange depend strongly on the characteristics of the thin surface layer of water, mainly on its temperature and that of the adjacent air layer. But the temperature of the thin surface layer of water, which affects the different forms of heat exchange, is independent on the direct influence of solar radiation, since absorption of radiation in a thin layer is negligibly small. The results testify to the fact that under normal conditions, except during severe storms for which data are lacking, the temperature gradient in the upper layer of water remains negative. (Knapp-USGS)

THE RESPONSE OF WATER TEMPERATURES TO METEOROLOGICAL CONDITIONS,
Vanderbilt Univ., Nashville, Tenn; Office of the Surgeon, Headquarters, U. S. Army Vietnam; and Johns Hopkins Univ., Baltimore, Maryland.

John E. Edinger, David W. Duttweiler, and John C. Geyer.
Water Resources Res, Vol 4, No 5, pp 1137-1143, Oct 1968. 7 p, 2 tab, 10 ref.

Descriptors: *Heat budget, *Surface waters, Heat balance, Temperature, Evaporation, Convection, Radiation, Meteorology, Air-water interfaces.
Identifiers: Surface temperature, Equilbrium temperature.

The calculation of heat exchange across air-water interfaces, one of the most important processes involved in thermal regimes of water bodies, is reviewed and discussed. The net heat exchange is the sum of the energy interchange by radiation, evaporation, and conduction between the water and air. Observable meteorological variables are used to calculate the thermal exchange coefficient and equilibrium temperature, which are used together to calculate net heat exchange. Many mathematical formulas and descriptions are available for use in thermal balance calculation. Temperature distributions within water bodies may be calculated in some relatively simple cases. Heat exchange calculations are necessary in predicting evaporation from proposed storage facilities. (Knapp-USGS)

INTRA-ANNUAL DISTRIBUTION OF SUBTERRANEAN FLOW INTO RIVERS,
T. M. Chernaya.
Soviet Hydrol, Selec Pap No 1, pp 25-41, 1967. 17 p, 4 tab, 4 ref, 1 append.

Descriptors: *Surface-groundwater relationships, *Bank storage, *Groundwater movement, Discharge (Water), Base flow, Streamflow, Statistical methods, Data collections, Hydrogeology, Permafrost.
Identifiers: USSR, Physiographic controls, Subterranean flow.

Groundwater flow into rivers of the USSR is analyzed and discussed, using data from a collection made in compiling a map of groundwater flow for the USSR. Groundwater discharge has significant annual low and high flow periods. Periods of high discharge from alluvium generally last one season, usually spring, in the plains and generally 3 seasons, spring through autum, in permafrost regions. Low alluvial flow lasts one season in warm areas and may be zero in permafrost regions. Flows for 39 rivers are tabulated. Preliminary results of a statistical analysis of the relation of groundwater discharge to physiographic parameters are presented in tables. In addition to problems concerning methods of computing intra-annual distribution of subsurface flow, an examination is made of results of an analysis of distribution patterns under various physiographic conditions. (Knapp-USGS)

METHOD OF DETERMINING THE EFFECTIVENESS OF HYDROLOGIC FORECASTS IN ESTABLISHING THE OPERATING CONDITIONS OF HYDROELECTRIC POWER PLANTS,
S. B. Yelakhovskiy.
Soviet Hydrol, Selec Pap No 1, pp 81-90, 1967. 10 p, 4 fig, 7 ref.

Descriptors: *Statistical methods, *Routing, Hydroelectric plants, Stochastic processes, Systems analysis, Mathematical studies, Management.
Identifiers: *Hydrologic forecasts, USSR, Volga River.

Principals for establishing the operating conditions of hydroelectric power plants are described. The effectiveness of several methods of predicting inflow to reservoirs used for electric power generation in the USSR is examined. For short term predictions of a year or less, hydrographs, routing methods, and other deterministic methods are highly accurate. For long term prediction, only probabilistic methods are reasonably reliable. Graphs and mathematical equations are presented. The method used to evaluate forecast effectiveness is illustrated by sample calculations for the Lenin Hydroelectric Power Plant on the Volga. (Knapp-USGS)

FLOOD SURGE ON THE RUBICON RIVER, CALIFORNIA--HYDROLOGY, HYDRAULICS AND BOULDER TRANSPORT,
U S Geological Survey, Washington, D. C.
Kevin M. Scott, and George C. Gravlee, Jr.
U S Geol Surv Prof Pap 422-M, pp M1-M40, 1968, 40 p, 33 fig, 5 tab, 34 ref.

Descriptors: *Floods, *Dam failure, *Surges, *Geomorphology, Erosion, Sediment transport, Sedimentology, Deposition (Sediments), California, Historic flood.
Identifiers: *Torrential rainfall, *Hell Hole Dam, Rubicon River (California).

The sedimentologic and geomorphic effects of a single catastrophic flow, caused by the failure of the Hell Hole Dam on the Rubicon River, in the Sierra Nevada, California on Dec 23, 1964, are documented. Extensive erosion of outwash terraces indicates a flow probably greater than any post-Pleistocene discharge. A rainfall of 22 in. in the 5 days preceeding the failure produced record peak discharges. The surge discharges were greater than the previous record along the entire 61 miles route downstream, including the Rubicon, Middle Fork American, and North Fort American Rivers. As far as 36 miles downstream, flows were still 3.3 times the 100 yr flood. Average flood wave velocity was 22 fps. The diorite rockfill in the dam acted as a tracer; particles of fill moved no farther than 2.1 miles, and rounding of particles took place within 1.5 miles. Intense local erosion initiated many landslides and other lateral sources of sediment. It is concluded that catastrophic floods may strongly influence mountain stream morphology without much effect on total sediment transport. They may modify bed patterns, cause cycles of increased mass movement, cause mass flow of coarse detritus in the channel, and cause extensive lateral supply of extremely coarse sediment. Flood debris is later dispersed by lower flows acting with weathering in place. (Knapp-USGS)

SOME FACTORS AFFECTING BASEFLOW,
Illinois State Water Survey, Urbana.
Krishan P. Singh.
Water Resources Res, Vol 4, No 5, pp 985-999, Oct 1968. 15 p, 8 fig, 15 ref.

Descriptors: *Base flow, *Recression curves, *Hydrograph analysis, Groundwater movement, Surface-groundwater relationships, Mathematical studies, Statistical methods, Evapotranspiration, Aquifers, Recharge.
Identifiers: Boussinesq equations.

Recession curves of stream-aquifer systems are analyzed and discussed in connection with problems of streamflow regulation for pollution control, farming practice evaluation, locating suitable areas for induced infiltration, and estimating the increase in baseflow from infiltration. For a shallow aquifer and a fully penetrating stream, the ideal baseflow curve may not be plotted as a straight line on semilog paper, and its recession rate continuously decreases with time. For a deep aquifer and a shallow-entrenched stream, the ideal base-flow generally decays exponentially, and its recession rate decreases with increasing stream entrenchment. In the case of loss from evapotranspiration, the baseflow curves steepen progressively with time, and the stream may become influent. In the case of gain from confined aquifers, the baseflow curves become flatter. The recharge results in shifting of the baseflow curves upward in magnitude or laterally in time. The baseflow peak occurs at about 0.75T from the beginning of recharge to the aquifer, where T denotes the effective duration of recharge. The lag between the total flow peak and the baseflow peak depends on rainfall, soil, and basin factors. The variability of these factors precludes the notion of a constant lag. (Knapp-USGS)

COMPREHENSIVE BASIN STUDY SABINE RIVER AND TRIBUTARIES, TEXAS AND LOUISIANA.
Corps of Engineers, Fort Worth District.

Main Rep, Vol 1, Comp Basin Study, 183 p, Dec 1967. 4 fig, 10 plate, 28 tab, 5 append.

Descriptors: *Data collections, *River Basin Development, Flood control, Land management, Water supply, Watershed management, Transportation, Navigation, Recreation facilities, Texas, Louisiana, Water utilization.
Identifiers: *Sabine River Basin (Texas-Louisiana), Comprehensive planning.

A comprehensive study of the water resources, including recreational potential, hydroelectric power potential, and need for flood control of the Sabine River Basin, Texas and Louisiana, was made by the U S Army Corps of Engineers, U S Departments of Agriculture, Commerce, Health Education and Welfare, Interior, Federal Power Commission, and the States of Louisiana and Texas. The Sabine basin has major floods of long duration and frequent smaller floods. There are no major flood control improvements. Because channel capacities are inadequate, flood release channels are recommended. Water demands were projected to 2075. Both quantity and quality of water need to be adequate to meet projected demand. Recommen

dations for improvements include 3 major reservoirs at Mincola, Lake Fork, and Big Sandy, Greenville flood protection works, a navigation project from Echo to Pruitt Bluff, and 11 upstream watershed improvement projects. Estimated total construction cost is $191,143,000 with $1,684,600 annual cost. The benefit-cost ratio is 1.6 to 1. (Knapp-USGS)

Agricultural Research Service Hydrograph Lab., Beltsville, Maryland.
C. A. Onstad, and D. L. Brakensiek.
Water Resources Res, Vol 4, No 5, pp 965-971, Oct 1968. 7 p, 3 fig, 2 tab, 12 ref.

Descriptors: *Hydrographs, *Routing, *Runoff forecasting, *Synthetic hydrology, Overland flow, Flow nets, Model studies, Simulation analysis, Watersheds (Basins).
Identifiers: Watershed models.

A model is proposed by which an outflow hydrograph is synthesized by routing input through a simulated drainage system. The simulated flow system is developed from a flow net. Overland flow is routed through paths defined by pairs of stream lines constructed normal to the contour lines (equipotentials) of the watershed, terminating at intersections with definite surface channels. Channel flood routing is then performed down to the basin outlet, with the calculated overland flow from each flow path as lateral input. Optimization of the system parameters is studied with respect of factors calculated from hydrograph moments. By comparison with visual judgments the hydrograph lag and shape factor were found to be possible criteria for optimization. (Knapp-USGS)

MAPS OF MINIMUM STREAMFLOW IN THE ASIATIC USSR,
V. A. Baranov, Z. I. Petersen, and L. N. Popov.
Translation from Trudy Gos Gidrol Inst No. 139, 1967, pp 24-35. Soviet Hydrol, Selec Pap No 1, pp 16-25, 1967. 10 p, 3 fig, 1 tab, 3 ref.

Descriptors: *Data collections, *Low flow, *Base flow, *Hydrogeology, *Maps contours, Discharge (Water), Permafrost.
Identifiers: Asiatic USSR, Low-flow estimation.

A description is given of the distribution characteristics of minimum streamflow in Asiatic USSR. Minimum average monthly summer and winter runoffs are presented in 2 isoflow contour maps. Runoff characteristics for the Urals, West Siberian lowland, Kazakh folded country, Central Siberian highland, Altai and Sayan Mountains, Transbaikalia, Northeast Siberia, Far East Siberia, Sakhalin, and Kamchatka are described briefly. Flows and variability of flow are tabulated for 36 sub-regions. No account was taken of data on rivers regulated by lakes or reservoirs. The maps were compiled from field observations and from conversion factors. Data used in the compilation were collected at 3,955 hydrological stations between 1959 and 1966. (Lang-USGS)

Pub Works, Vol 94, No 11, p 74, 1963.

Descriptors: Drainage system, *Land use, *Runoff.
Identifiers: Surface permeability, *Urban drainage, *New Orleans (La).

Results of a study to determine times of concentration and obtain an accurate value for the coefficient of imperviousness of one of the large drainage districts of the city of New Orleans, La., carried out in cooperation with the Sewerage and Water Board, are summarized in Tables and discussed. Results indicate that the coefficient for built-up areas, which comprise over 4000 acres in the district is 0.548 whereas the coefficient for a typical suburban area is 0.455; the coefficient for the entire drainage district is 0.559. The Rational formula was employed to determine run-off coefficients using a 79-minute time of concentration, and the average value obtained was 0.653, this value being within the ranges recommended for combined residential and commercial areas.

STUDIES OF SEVERE RAINSTORMS IN ILLINOIS,
G. E. Stout, and F. A. Huff.
ASCE Proc, J of Hydr Div, Vol 88, No HY4, p 129, July 1962.

Descriptors: *Rain gages, Watersheds, *Storms.
Identifiers: Urban drainage.

Study included a network of 10 recording rain gauges on a 10 sq mi urban area and investigated distribution characteristics of heavy rainstorms over urban watersheds for 10 year period. It was found (1) twice as many excessive quantities occur within a 10 mi2 area compared with a specific point within area; (2) the percent of the 10 mi2 area experiencing excessive rainfall increases with increasing storm duration; (3) majority of the excessive quantities of rainfall lasting from 30 to 24 hr occur in the same storms; (4) although a single rain gage records only a portion of the excessive rate occurrences in 10 mi2, a point rainfall record is satisfactory index of frequency distribution of areal mean rainfall; (5) urban influences, if present, are not of practical significance in the distribution of excessive quantities.

RUNOFF ESTIMATION FOR VERY SMALL DRAINAGE AREAS,
Warren Viessman.
Water Resources Res, Vol 4, No 1, pp 87-94, Feb 1068.

Descriptors: *Storm runoff, *Hydrographs, *Runoff forecasting, Rainfall-runoff relationships.
Identifiers: *Urban hydrology.

Analyses of hydrologic data from high-intensity short-duration storms on very small drainage areas

having varying physical characteristics indicated that a 1-minute unit hydrograph could be used as the basis for generating runoff from an effective rainstorm input. The single parameter of the unit hydrograph (time constant K) was shown to be related to the physical characteristics of the drainage area. No evidence of the correlation between K and the storm pattern was discovered. Procedures are given for estimating net storm inputs.
W69-01900

THE HYDROLOGY OF SMALL IMPERVIOUS AREAS,
W. Viessman.
Water Resour Res, Vol 2, pp 405-412, 1966.

Descriptors: *Storm runoff, *Hydrographs, Rainfall-runoff relationships.
Identifiers: *Urban drainage, *Urban hydrology, Surface permeability.

A method for computing storm-water run-off from small, impervious, urban areas is described in which consecutive 1-minute unit hydrographs are determined for a storm and summed to provide a total outflow hydrograph. Calculations are based on the assumption that such areas behave as linear reservoirs and take account of the drainage-area lag time and losses due to depression storage. Good agreement was obtained between actual and computed hydrographs, and peak discharges for 30 storms were predicted with an average absolute error of 9 per cent.

PROGRESS REPORT ON THE STORM DRAINAGE RESEARCH PROJECT, JULY 1, 1958, TO JUNE 30, 1959,
Johns Hopkins Univ., Dept. Sanit. Eng. Water Resour., Baltimore.
W. Viessman.

Descriptors: *Storm drainage, *Runoff forecasting, Storm runoff, Hydraulics, *Intakes, *Design, *Rain gages, *Weirs, *Flow measurement, *Instrumentation, *Rainfall-runoff relationships, *Rainfall intensity.
Identifiers: *Urban hydrology, *Urban drainage.

In 1949, a research project was initiated in Baltimore, Md., to solve problems connected with urban storm drainage, including the development of a reliable method for predicting storm water runoff. In the first 7 years, the hydraulic characteristics of storm water inlets were investigated, and on the basis of the results, the design of such inlets was modified, a very efficient square grate was designed, and a method was provided for matching the inlet capacity with the drain capacity. New instruments have been developed for measuring and recording rainfall and storm run-off, including a special weir for measuring flows into storm water inlets, and a pressure-type depth-recording system. At present, studies are being carried out on the hydrological relations between rainfall and urban run-off. On the basis of measurements of rainfall and run-off over a period of 4 years, it was concluded that the Rational Method used in designing urban storm drainage systems gives unreliable estimates of the peak rate of run-off, and a new method of design, known as the Inlet method, was developed. This method is based on the maximum 5-minute rainfall intensity at each inlet, and a study has therefore been made of the relation between maximum and short-interval rainfall intensity and the duration of the intense part of a storm. Studies are also in progress to determine the range of applicability and statistical validity of the new method, the effect of antecedent rainfall on the peak discharge for a drainage area, and the timing and attenuation of storm water flows in closed drainage systems.

RETARDATION OF DISCHARGE IN PUBLIC WATERS WITHIN THE AREA OF A COMMUNITY,
W. Kadner.
Gas-Wasserfach, Vol 109, No 6, pp 158-159, 1968.

Descriptors: *Storm runoff, *Overflow, *Rainfall-runoff relationships, Design, *Drainage systems.
Identifiers: *Combined sewers, *Storm sewers, Urban drainage.

Public waters often serve as the unloading place for rainwater overflows of mixed sewer systems or rainwater mains of separate systems. In sizing such streams, it is difficult to follow the usual corresponding methods for town drainage and Kehr's rainwater run-off diagram does not permit the determination of maximum run-off any more. It is claimed that the method described has the advantage of permitting the determination of run-off at any point in the stream and thus, also, of the respective design flow. Moreover, it makes it possible to add new drainage areas and to determine the volume of the permissible maximum amount and to make corrections for the developed progress line without too much effort.

CONTRIBUTION TO THE DETERMINATION OF THE DIMENSIONS OF RAIN STORAGE TANKS,
W. Kadner.
Gesundheits-Ing, Vol 88, pp 124-127, 1967.

Descriptors: Rainfall intensity, *Storm runoff.
Identifiers: *Combined sewers, *Storage tanks, *Capacity, *Calculations.

The author compares two methods, the Muller-Neuhaus and the Randolf, for the determination of suitable dimensions for storm-water storage tanks in combined sewerage systems. He stresses the importance of determining a progression from observations of rainfall in the place concerned and of referring to this in the calculations; those made for the town of Karlsruhe, Germany, are given as an example, with tables and graphs. No significant difference was found between the results obtained by the two methods, but the Randolf method is more suitable when a series of tanks is to be used.

ROLE OF A GULLY-RAVINE NETWORK IN THE FEEDING OF GROUND WATER AND METHOD OF DETERMINING ITS AREAS,
B. S. Ustyuzhanin.
Translation from Trudy Gos Gidrol Inst No. 139, 1967. pp 224-232. Soviet Hydrol, Selec Pap No 1, pp 56-63, 1967. 8 p, 4 fig, 2 tab, 17 ref.

Descriptors: *Groundwater recharge, *Infiltration, *Snowmelt, *Gullies, *Ravines, *Ephemeral streams, Maps, Estimating, Snow cover, Intermittent streams.
Identifiers: *Water balance studies, USSR, Snowmelt infiltration.

Investigations conducted in various parts of the European USSR show that groundwater recharge through a network of ephemeral streams in ravines, gulches, and gullies, reduces meltwater runoff in spring. Snow is blown off flat areas and collects in ravines, where it protects the ground from freezing. When the snow melts, infiltration occurs first and most rapidly in ravine bottoms where the soil is not frozen as deeply as on the flats. The ratio of snow-filled ravines to bare uplands is not easily determined from presently available topographic maps but may be estimated from agricultural use maps with plowed-area information, because plowing is done only on upland flats. Ravines occupy from about 9-25% of the surface area in the regions stu

died. Conversion factors relating ravine network length to area covered for several regions of USSR are tabulated to aid in estimating ravine area where no agricultural use maps are available. (Knapp-USGS)

TURBULENT FLOW IN POROUS MEDIA,
Melbourne Univ., Australia, and Water Res Foundation of Australia.
C. E. Kirkham.
Water Res Found of Australia Bull No 11, 146 p, Sept 1967. 6 tab, 31 fig, 94 ref, append.

Descriptors: *Turbulent flow, *Porous media, *Computer programs, Laplaces equation, Darcys law, Reynolds number, Model studies, Mathematical models, Digital computers, Analytical techniques.
Identifiers: Australia, Experimental Model study.

Turbulent flow in porous media was studied by numerical, model and analog methods to develop a field equation suitable for all porous media flow. Energy loss equations for various types of media were determined and methods of analysis were developed and applied to flow fields such as groundwater flow to wells, flow through and over rockfill banks, and confined flow through right angled bends and sectors. The general equation is applicable to laminar, turbulent or transition flows. Analytical solutions of the equation are presented for simple boundary conditions and compared with solutions using Laplace's equation to illustrate the inaccuracy of the Laplace method when Darcy's law is not obeyed. For complicated boundaries, a digital computer program for IBM 7044 is presented and a FORTAN listing is included. The equation was verified with a model study. The model was a gravel-filled 90 deg miter bend with unequally long and wide legs. (Knapp-USGS)

2G. Water in Soils

STEADY INFILTRATION FROM BURIED POINT SOURCES AND SPHERICAL CAVITIES,
CSIRO Division of Plant Industry, Canberra, Australia.
J. R. Philip.
Water Resources Vol 4, No 5, pp 1039-1047, Oct 1968. 9 p, 6 fig, 15 ref.

Descriptors: *Infiltration, *Unsaturated flow, *Porous media, *Mathematical studies, Soil moisture, Hydraulic conductivity, Capillary conductivity, Darcys law, Diffusion.
Identifiers: Point source infiltration, Spherical cavity source infiltration, Quasilinearization.

An analysis is given of unsaturated flow regimes of prolonged infiltration into regions of deep water table from point sources and from spherical cavities. The analysis is simplified by assuming that it does not involve a free surface. Hydraulic conductivity is represented by an exponential function of moisture potential and the nonlinear steady flow equations is transformed into a linear equation formally equivalent to the equation for diffusion in a moving medium. The point source solution is extended to the analysis of infiltration from spherical cavities. Although the rate of infiltration from cavities with small or dimensionless radius is determined mainly by capillarity, gravity distorts the moisture distribution pattern strongly, whatever the cavity radius. (Knapp-USGS)
W69-01614

A SOLUTION FOR VERTICAL INFILTRATION INTO A DRY POROUS MEDIUM,
Cornell Univ., Ithaca, New York.
Wilfried Brutsaert.
Water Resources Res, Vol 4, No 5, pp 1031-1038, Oct 1968. 8 p, 4 fig, 1 tab, 9 ref.

Descriptors: *Infiltration, *Unsaturated flow, *Porous media, *Mathematical studies, Soil moisture, Hydraulic conductivity, Diffusivity, Diffusion, Capillary conductivity, Darcys law.
Identifiers: *Vertical infiltration.

An exact solution is presented for the second term of the series expansion of the numerical solution of the concentration-dependent diffusivity equation of J R Philip. The use of simple algebraic functions describing the water content-capillary suction and water content-capillary conductivity relationships of porous media makes the exact solution possible. Terms higher than second order are negligible because of fast convergence. Use of a previous solution for the first term of the expansion together with this solution for the second term is a satisfactory method of calculating vertical infiltration. The method was found to be in good agreement with results of infiltration experiments on Columbia silt loam. (Knapp-USGS)

INFLUENCE OF THE PHYSICAL AND CHEMICAL PROPERTIES OF SOIL ON MEASUREMENTS OF WATER CONTENT USING NEUTRON PROBES,
Vincenzo Cotecchia, Angelo Inzaghi, and Enzo Pirastru.
Water Resources Res, Vol 4, No 5, pp 1023-1028, Oct 1968. 6 p, 2 fig, 2 tab, 12 ref.

Descriptors: *Soil moisture meters, *Nuclear moisture meters, *Calibrations, *Neutron absorption, *Porous media, Measurement, Soil water, Pervious soils, Soil groups.
Identifiers: Neutron flux soil moisture meters, Neutron capture cross sections, Multigroup transport theory.

The influence of soil physical and chemical properties on neutron probe soil water measurement was studied by using multigroup transport theory to calculate thermal neutron flux at various water contents in each soil studied. The media considered are siliceous sand, limestone, dolomitic limestone, and terra rossa. Although elements with high capture cross sections were not present, the media behaved differently in neutron moderation, diffusion, and capture, so that probe response was variable at equal water content in rocks of the same dry density. Interpretation of the results without knowing the effect of the media is not reliable. Agricultural soils, however, show no such differences in neutron behavior. (Knapp-USGS)

2H. Lakes

GEOLOGICAL STUDIES OF LAKE MICHIGAN,
Michigan Univ., Ann Arbor, Great Lakes Research Div., Inst. of Science and Tech.
Jack L. Hough.
Part of final report of USPHS Grant WP-00311. Spec Rep No 30 of Great Lakes Res Div, pp 228-246, 1967. 19 p, 12 fig, 1 tab, 2 ref. ONR-104-818.

Descriptors: *Lake Michigan, *Topography, *Geologic investigations, *Lake beds, Cores, Dredging, Maps, Sediments, Seismic studies, Radioactive dating, Lake stages.
Identifiers: *Bedrock framework, Sub-bottom profiles, Topographic maps.

The topography and geology of the bottom of Lake Michigan were studied by sounding, seismic profiling, and dredging samples. A topographic atlas consisting of four section maps, scale 1:120,000 are published, and quadrangles of scale 1:31,680 were constructed for this study. A 3-dimensional model of the lake basin is under construction. Core samples were taken to investigate sediments in the upper few ft of the bottom with particular emphasis on learning about late glacial to recent depositional changes, particularly changes resulting from human activity. Study of the cores shows that the lakes was relatively barren until a slight degree of eutrophication began just before civilized man reached the area, and eutrophication has continued until the present. Almost no evidence of civilization can be seen in core samples. Core logs also show a low water stage between 10,000 and 4,200 years ago, when the water surface was 350 ft below present lake level. Radiocarbon dating of bottom materials is in progress. (Knapp-USGS)
W69-01619

WATER QUALITY AND EUTROPHICATION TRENDS IN SOUTHERN LAKE MICHIGAN,
Michigan Univ., Ann Arbor, Great Lakes Research Div., Inst. of Science and Tech.
Charles F. Powers, and John C. Ayers.
Part of final report of USPHS Grant WP-00311. Michigan Univ Spec No 30 of Great Lakes Res Div, pp 142-178, 1967. 37 p, 6 tab, 10 fig, 14 ref. ONR-104-818.

Descriptors: *Data collections, *Chemical analyses, *Lake Michigan, *Eutrophication, Water quality, Silica, Calcium, Magnesium, Sulfates, Chlorides, Phosphorus, Nitrates, Biological properties.
Identifiers: *Macrobenthos, Chicago, Milwaukee, Grand Rapids, Whiting, Michigan City.

Chemical analyses of water from municipal water system intakes in the southern part of Lake Michigan were used to study recent trends in water quality and eutrophication. The intakes of the water systems of Grand Rapids, Chicago, and Milwaukee supplied most of the samples, and Whiting and Michigan City supplied a few of less value. The longest record period is 1926-present, at Chicago. Calcium and Magnesium were chosen as standards of comparison because human activity should have little effect on their concentrations. Regression lines in plots of analyses show no significant changes with time. Sulfate, chloride, and total solids are increasing. Silica is decreasing, possibly because of increasing diatom growth with increasing lake productivity. Phosphorus fluctuates markedly at Chicago but open-water samples show no trend. Generally, shore values of all analyses agree very well with open lake values. Dissolved solids, particularly those put in the lake by human activity, are increasing. Other studies show corresponding biological changes that have occurred within the lake. The changes are probably associated with the environmental alteration evident in the long-term change in concentrations of ions and other solids. (Knapp-USGS)

THE GRAND RIVER AND ITS PLUME IN LAKE MICHIGAN,
Michigan Univ., Ann Arbor, Great Lakes Res Div, Inst of Science and Tech.
John C. Ayers, and Ronald Rossman.
Michigan Univ Spec Rep No 30 of the Great Lakes Res Div, pp 366-371, 1967. 6 p, 3 fig, 2 tab, 2 ref.

Descriptors: *Dispersion, *River flow, *Lake Michigan, Turbidity, Temperature, Conductivity, Color, Dissolved oxygen, Water pollution effects.
Identifiers: *Dispersal plume, Grand River (Michigan).

The discharge and mixing of the Grand River, Michigan, into Lake Michigan were studied by sampling the river at 3 stations and taking 7 turbidity samples from the plume of river water in the lake. The river water quality is influenced by several cities and was brown and stained with what appeared to be humic material. Its turbidity ranged from 34.0 ppm to 84.5 ppm. Dissolved oxygen was 8.1 mg/l and 97% saturated. River water conductivity was 550 micromhos/cc at the end of the breakwaters and lake water conductivity was 277. River water temperature was 23.0 deg C while lake water temperature was 18-19 deg. The dispersion plume was mapped by calculating percentage river water at 7 stations on the basis of turbidity, temperature, and conductivity. The studies indicate that dispersal plume study may provide good information on the behavior of nearshore lake waters. (Knapp-USGS)

TEMPERATURE STRUCTURE OF LAKE MICHIGAN,
Michigan Univ., Ann Arbor, Great Lakes Res Div, Inst of Science and Tech.
Vincent E. Noble.
Michigan Univ Spec Rep No 30 of the Great Lakes Res Div, pp 340-365, 1967. 25 p, 1 fig, 4 tab, 3 ref.

Descriptors: *Lake Michigan, *Water temperature, Thermocline, Thermal stratification, Computer programs, Digital computers.
Identifiers: *Temperature structure.

Bathythermograph data for Lake Michigan were put on computer cards and processed by computer. The thermal structure of the lake is presented in tables giving temperature-depth relationships for each month of 1963-1966 at each station listed by latitude and longitude. The computer program used is described, discussed, listed. Conspicuous features in the results are that the summer period when the thermocline exists lasts from the middle of June to the middle of November, and the deep water is warmest at the fall mixing at the end of November or really December. ANNUAL GROWTH CYCLE, GROWTH POTENTIAL, AND GROWTH COMPENSATION IN THE BLUEGILL SUNFISH IN NORTHERN INDIANA LAKES,
Indiana Univ., Bloomington. Dept. of Zoology.
Shelby D. Gerking.
J Fish Res Board Canada, Vol 23, No 12, pp 1923-1956, 1966. 34 p, 7 fig, 6 tab, 54 ref.

Descriptors: *Secondary productivity, *Sunfishes, *Growth rates, Indiana, Lakes, Productivity, Fish, Period of growth, Indicator organisms, Thermoperiodism, Photoperiodism, Feeding rates.
Identifiers: *Bluegills, *Lepomis, Sylvan Lake, Carr Lake, Maxinkuckee Lake, Spear Lake, Crooked Lake, Ridinger Lake, Pretty Lake, Growth hormone, Glacial lakes, High Lake.

Eight lacustrine populations of bluegill sunfish with widely varying growth rates exhibited a surge of growth in spring followed by a progressive decline in late summer and autumn. Growth rate declined as age increased; in no case did growth of an older age group exceed that of a younger age group in the same year. Length of growing season (period between annulus formation and achievement of 90% annual growth) varied among lakes and between years in same lake (mean: 152 days; range: 98 (Ridinger L)--189 (Maxinkuckee L)). In Ridinger L, season extended a month longer in 1963 than in 1962, but this difference was not evident in other lakes. When ranked according to growth rate of resident fish, each lake retained same position in both 1962 and 1963. Populations experiencing longer growth seasons grew more rapidly than those with shorter seasons. Author presents evidence that all populations demonstrated approximately equal growth potential as judged by weight increment of fish of group III. Growth compensation may result from earlier inception of growth in smaller fish. Author reviews possible explanations of annual growth cycles as related to temperature, photoperiod, and interactions between growth hormone and seasonal feeding rates. (Wis)

2I. Water in Plants

ALBEDO OF INTERCEPTED SNOW,
Northeastern Forest Experiment Station and Syracuse Univ., College of Forestry, Syracuse, New York.
Raymond E. Leonard, and Arthur R. Eschner.
Water Resources Res, Vol 4, No 5, pp 931-935, Oct 1968. 5 p, 4 fig, 2 ref.

Descriptors: *Interception, *Snow, *Albedo, *Evaporation, Energy budget, Radiation, Water loss, Conifers, Red pine trees.
Identifiers: Intercepted snow loss, Solar altitude.

Incident and reflected shortwave radiation above a red pine plantation was measured at 30-minute intervals for 2 days after a 12-in. snowfall to determine whether enough energy is absorbed to evaporate a significant amount of the intercepted snow. Maximum albedo was less than 20% of incident radiation, compared with the 70-90% for fresh snow on the ground and commonly assumed to apply also to intercepted snow. Energy available for evaporation of intercepted snow may be 4 times the amount previously assumed. As intercepted snow aged, albedo decreased and eventually approached summer values when snow left the upper part of the canopy. With an albedo of 0.20 a net solar radiation of 36 langleys per hour caused evaporation of 0.6 mm water per hour, or 2.00 mm per day, showing that a considerable amount of intercepted snow may be lost to evaporation. (Knapp-USGS)
W69-01598

CONVERSION OF HARDWOOD-COVERED WATERSHEDS TO WHITE PINE REDUCES WATER YIELD,
Southeastern Forest Experiment Station, Asheville, N. C.
W. T. Swank, and N. H. Miner.
Water Resources Res, Vol 4, No 5, pp 947-954, Oct 1968. 8 p, 6 fig, 1 tab, 17 ref.

Descriptors: *Water yield, *Forests, *Reforestation, *Interception, *Watershed management, Coniferous forests, Deciduous forests, White pine trees, Canopy, Demonstration watersheds.
Identifiers: Southern Appalachians.

Mixed mature hardwoods were cleared from two Southern Appalachian experimental watersheds and the cleared areas were planted with eastern white pine to determine the effect of forest composition on runoff. When the pine crowns began to close, streamflow steadily declined at a rate of 1 to 2 in. per year. By 1967, water yield was 3.7 in. less from a 10-year-old pine stand on a southfacing watershed than expected water yield from the original hardwood forest. Most of the water yield reduction occurred during the dormant season and was attributed mainly to greater interception loss from white pine than from hardwoods. Because interception differences increase as white pine matures, an even greater reduction in streamflow is expected. (Author)

RELATION OF SEDIMENT LOAD TO HYDROLOGICAL CHARACTERISTICS OF

CONNECTICUT RIVER BETWEEN NORTHFIELD AND SPRINGFIELD, MASSACHUSETTS,
Massachusetts Univ., Amherst, Dep of Geology.
Miles O. Hayes.
Mass Univ, Water Resources Res Center Symp Proc, Publication No 3, pp 53-61, June 2, 1967, 9 p, 1 fig, 3 tab, 2 ref.

Descriptors: *Sediment load, *Connecticut, River basins, Bed load, Suspended load, Depth, Velocity, Dams, Massachusetts, Laboratory tests, Particle size.
Identifiers: Connecticut River, Geologic controls.

The sediment load of the Connecticut River, the largest river in New England, is being studied. Geographic and geologic settings are described. A longitudinal profile of the river from Turners Falls Dam to Holyoke Dam was drawn. Velocity measurements and mean diameter of the bed load are plotted. North of Amherst, Mass, the predominant bed load is gravel, and south of Amherst it is sand. Partial analyses of sediment sizes from the main channel and tributaries are tabulated. (Knapp-USGS)

FALL VELOCITY OF IRREGULAR SHAPED PARTICLES,
Michigan Technolog Univ., Houghton, and Colo. State Univ., Ft. Collins.
George R. Alger, and Daryl B. Simons.
ASCE Proc, Jour Hydraul, Vol 94, No HY3, Paper 5949, pp 721-737, May 1968. 17 p, 11 fig, 4 tab, 6 ref, 2 append.

Descriptors: *Particle shape, *Settling velocity, *Hydraulics, Fluid mechanics, Particle size, Flow separation, Vortices, Sediments, Reynolds number, Resistance.
Identifiers: *Shape factor, *Fluid flow, Drag, Vortex formation, Particle motion, Fluid viscosity.

The importance of surface area and volume of particles in sediment fall velocity is determined and a particle shape factor is developed that includes these variables. Free-fall velocity of variously shaped particles in fluids of different viscosity is determined. A shape parameter is proposed which correlates Reynolds number with drag coefficient to describe the motion of irregular shapes. This results in a useful Reynolds number-drag coefficient relation. Data for analysis were collected from tests of natural gravel-sized particles of various shapes and sizes supplemented by larger geometric shapes. The basic motions--sliding, tipping, and rotation--of particles in free fall may occur separately or be combined depending on such causes as flow separation and vortex formation. (Lang-USGS)

ROLE OF SILT IN WATER POLLUTION,
R. D. Walker.
Amer Water Works Ass J, Vol 58, No 11, pp 1483-1488, Nov 1966. 6 p, 2 tab, 1 fig, 6 ref.

Descriptors: *Illinois, *Silts, Water pollution sources, Agricultural watersheds, Surface runoff, Erosion, *Erosion control, *Gully erosion, Sheet erosion, Desilting, Sedimentation, Conservation, Dams.

Silt is defined as any soil material carried by moving water or deposited as sediment. The amount of silt reaching a reservoir or treatment plant can be reduced by soil conservation practices within the watershed. The two major kinds of soil erosion are gully erosion and sheet erosion. Gully erosion occurs where water flow is concentrated while sheet erosion carries away a thin layer of soil with each rain. Soil erosion occurs in two phases: (1) the impact of the rain breaking loose soil particles and (2) surface runoff carrying away the particles. Erosion may be held to a minimum by reducing the impact, usually with a vegetative cover, and minimizing runoff speed. On agricultural land this may be accomplished by proper crop rotation and contour farming. A universal equation has been developed by the Soil Conservation Service to figure soil losses in a given watershed before a conservation project and to compare them with probable losses afterwards. Urban construction also causes much soil loss. Dams constructed on the Missouri River have proved effective in reducing silt, as have other projects under the Watershed Protection and Flood Prevention Act and in the conservation districts which exist in all Illinois Counties. GROUNDWATER CONTAMINATION AND HYDROCHEMICAL FACIES OF SHALLOW AQUIFERS IN MASSACHUSETTS,
Massachusetts Univ., Amherst, Dep of Geology.
Ward S. Motts.
Mass Univ, Water Resources Res Center Symp Proc, Publication No 3, pp 29-38, June 2, 1967. 10 p, 1 fig, 5 tab, 5 ref.

Descriptors: *Groundwater, *Water quality, *Geochemistry, Aquifers, Salinity, Iron, Chlorides, Massachusetts, Geohydrologic units.
Identifiers: Hydrochemical facies, Groundwater contamination.

The chemical quality of water in shallow aquifers in Massachusetts was studied to learn the variation of quality caused by geology, geormorphic location, and contamination. About 40% of the wells studied are on floodplains, 16% above floodplains, 11% in swamps, 15% near lakes, and 18% on flats. The highest concentrations of Fe and Mn are near groundwater discharge areas and the lowest are in recharge areas. Most groundwater in the state is in the acidic facies, associated with non-calcareous rocks. The alkaline facies of western Massachusetts is associated with limestone; in the Connecticut valley the alkaline facies contains more sulfate and is associated with Triassic basalts and redbeds. In eastern Massachusetts an alkaline facies is associated with the Salem Gabbrodiorite. Mineralization is increasing slightly in the wells sampled. Over 50% of the wells sampled showed increases in Cl from 1955-66. 50% of those near discharge areas doubled in Cl, but none contain over 150 ppm Cl. The increase is caused by salt used for highway snow removal, drainage from dumps, septic tank pollution, and other causes. (Knapp-USGS)

2L. Estuaries

TURBIDITY MAXIMUM OF THE NORTHERN CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, Maryland, Chesapeake Bay Inst.
J. R. Schubel.
Science, Vol. 161, pp 1013-1015, Sept 6, 1968. 3 p, 2 fig, 10 ref.

Descriptors: *Estuarine environment, *Turbidity, *Suspended load, Streamflow, Rivers, Bay, Sediment distribution, Flocculation, Particle size, Circulation.
Identifiers: *Turbidity maxium, *Chesapeake Bay, Tidal cycles.

The turbid zone from head Chesapeake Bay at Turdey Point seaward for 32 km was comprehensively studied in 1966-67 and results are summarized. Samples collected fortnightly from several depths at each of 15 stations were analyzed for concentration of total suspended solids, combustible organic matter, the mineralogy, and size distribution of suspended particles. Other samples were collected at stations farther seaward in the estuary, and at several anchor stations where hourly measurements of current velocity, suspended sediment concentration, temperature, and salinity were made over 2 or more tidal cycles. Extensive size analyses of river and bay samples by a photomicrographic method and by a sediment technique failed to show any evidence of either flocculation or deflocculation of river-borne sediment. The turbidity maximum near the head of Chesapeake Bay is produced mainly by local resuspension of bottom sediments, and by the estuarine 'sediment trap' formed in the upper part of the estuarine circulation regime by the net nontidal circulation. 3B. Water Yield Improvement

GEOLOGIC FACTORS IN COMMUNITY DEVELOPMENT AT NAPERVILLE, ILLINOIS,
Illinois State Geological Survey, Urbana.
J. E. Hackett.
Environ Geol Notes No 22, 16 p, June 1966. 4 fig, 11 ref.

Descriptors: *Planning, *Illinois, *Water resources development, City planning, Long-term planning, Flood plain zoning, Local governments, Urbaniza-

tion, Water quality, Municipal water, Groundwater, Surface waters, Aquifers, Reservoirs.
Identifiers: *Physical environment, Dupage County (Illinois), Area development, Chicago suburbs, Geologic factors.

A planning study conducted by a citizens' committee of the Naperville Community Council reviewed the role of the physical environment in the development of an expanding community. Data on geology, groundwater resources, streamflow and extent of flooding are compiled. The city grew from 12,933 in 1960 to 18,734 in 1966; this has resulted in expansion of water, sewage disposal, and storm water drainage control facilities. The city is on the West Branch Dupage River which has an average flow of 50 cu ft per sec and carries waste from upstream sources. There is little possibility that surface water reservoirs of sufficient size will be developed because valleys are shallow, relief in the area is generally low, and streamflow is low. Groundwater supplies are available from sand and gravel deposits, the dolomite bedrock, and from deep sandstones. Present municipal wells include 4 in the dolomite and 1 in the deep sandstones. Total pumpage is 1.5 mgd, or about 75 gal per capita. The hardness is 400 to 500 ppm, but the water is free of bacterial pollutants. (Knapp-USGS)

3C. Use of Water of Impaired Quality

PLANNED CITY PLANS TO RE-USE STORM RUNOFF.

Environ Sci Technol, Vol 1, No 11, p 875, Nov, 1967.

Descriptors: *Water reuse, *Storm runoff, *Water pollution control, Equipment, Sewage treatment.
Identifiers: *Storage tanks, *Urban drainage, *Columbia (Md).

A plan to store storm water locally, thus controlling pollution, and then to amortize construction costs by reusing the water for high-volume needs is being studied in the planned city of Columbia, Maryland. The plan calls for collecting rain runoff in neighborhood reservoirs, or even in mass produced storage basins for individual residences. Methods and equipment for treating the water to make it suitable for non-drinking purposes are also being studied.

CHALLENGES IN THE WATER INDUSTRY,
Raymond J. Faust.
Journal of the American Water Works, Vol. 55, No. 6, June 1963, pp 661-667, 3 ref.

Descriptors: Water resource management, Municipal water supply, *Water quality control, Water rates, Standards, Revenue, Peak load, Research and development, Adoption of practices, Water quality, Administration, Administrative decision.
Identifiers: *Water utility industry, Water service, Consumer needs, American Water Works Association.

The water industry today faces many challenges. Service is the keystone of the water utility industry and excellent service must always be the goal. Inadequate planning is the main cause for inefficient service, causing deficiencies in one or more of the major facilities of a water system - that is, in source, treatment, pumping, transmission, storage, and distribution. Water quality, as measured by technical standards and consumer needs, is also one of the major areas needing research and improvement. To achieve the goal of quality water for the consumer a new water standard promulgated by the industry, through AWWA, will be needed. Many of the deficiencies of these two areas of service and quality can be ascribed to insufficient revenue. As the only significant source of revenue of a water utility is the sale of water, it becomes obvious that such sales should be based on rates that will yield sufficient money to operate and maintain the system, pay debt service, employ a competent staff and keep the plant up to date to meet peak loads and operating emergencies. The key to superior consumer service is the improvement of all the above mentioned factors, but this can only come from total management. Without qualified management it is impossible to meet the challenges of the industry. (Gargola-Chicago)

3F. Conservation in Agriculture

A STUDY OF EVAPORATION SUPPRESSANTS UNDER GREENHOUSE CONDITIONS: EVALUATION 1 AND 2,
South Plains Research and Experiment Center, Lubbock, Tex.
C. W. Windt, and J. R. Runkles.
Tex A and M Univ, Agr Exp Sta Progr Rep PR 2510 and PR 2542; 10 p, 13 p; Feb 9, 1968; May 15, 1968. 8 fig, 1 tab, 4 ref; 10 fig, 3 tab, 1 ref.

Descriptors: *Evaporation control, *Soil moisture, *Chemcontrol, *Oil, Air-earth interfaces, Water loss.
Identifiers: Crude oil, Polysaccharides, Anions, Cations, Latex.

Crude oil and crude oil plus additives including an anionic, a cationic, a nonionic, an oil-latex mixture an0 a polysaccharide-gum mixture were evaluated as evaporation suppressants on an Olton loam soil under greenhouse conditions. The 150-gallon-per-acre rates of crude oil was superior to a 50-gallon-per-acre rate. Evaporation was further suppressed when a cationic, oil-latex mixture and a polysaccharide-gum mixture were added to the 150-gallon-per-acre rate of crude oil. In some cases, the anionic enhanced suppression when it was added to crude oil but not as much as the cationic, oil-latex mixture or polysaccharide-gum mixture. The nonionic apparently decreased the ability of soil to suppress evaporation. An attempt was made to create a dry barrier on the soil surface using a propane flame. However, the moisture was replenished as fast as it was evaporated so that a dry layer was never created. (Knapp-USGS)
W69-01595

EVAPORATION FROM BOGS, DEPENDING ON CLIMATE, DRAINAGE, AND CULTIVATION (RUSSIAN),
A. I. Ivitskii.
Translation from Gidrotekh i Melior No 1-2, pp 62-66, 1968. TT67-51385 6 p. Issued by CFSTI.

Descriptors: *Wetlands, *Bogs, *Soil physical properties, *Soil chemical properties, Soil water plant relationships, Evaporation control, Runoff, Drainage effects.
Identifiers: *USSR, *Bog drainage, Marsh hydrology.

Results and conclusions of calculations previously made for undrained, drained, and cultivated bogs in the USSR are reviewed. The evaporation values obtained from the 1932-34 experiments on peat soil were carried out in evaporators of cross section 25 X 4 cm and 100 cm height. Also presented are experimental results from the Institute of Bog Management. These experiments were carried out with lysimeters on the Minsk bog station. An 0.8 X 0.8m cross-section lysimeter in which the peat was arranged in layers, was used; evaporation was determined by the volumetric method. It was concluded that evaporation from the peat soil without ground cover at shallow water table is higher, and at deep water table it is lower than the sum total of rainfall during the summer. Moreover, bog evaporation is lower than evaporation from the water surface. A drained but uncultivated bog evaporates about half the water evaporated by an undrained bog, but cultivated grasses in a drained bog reduces evaporation as compared with undrained conditions. Thus, drainage of bogs without subsequent cultivation increases total runoff. (Laverias-USGS)

Water Resources Res, Vol 4, No 5, pp 1059-1067, Oct 1968, 9 p, 6 fig, 1 tab, 13 ref.

Descriptors: *Seepage, *Earth dams, *Homogeneity, Levee, Mathematical studies, Darcys law, Methodology, Computer models, Permeability, Steady flow, Phreatic lines.

Identifiers: *Relaxation technique, Free streamline.

An investigation is made of the problem of seepage through a homogeneous earth dam or levee assuming the flow is plane, steady, and governed by Darcy's law. The Laplace equation is used as the governing equation for the pressure head, with straightforward boundary conditions except at the phreatic surface. This surface is a free streamline whose location is initially unknown. Solution of the problem is reached by adopting the relaxation method for machine computation. Solutions obtained for separate executions having widely different initial positions of the streamline agreed closely. The solutions required from 50 to 70 seconds on an IBM 7090, and they agree well with the longhand computations of Shaw and Southwell. The computer flow rates agree closely with the theoretical discharge of the Dupuit formula. Variations in permeability, which are difficult or impossible to deal with by classical methods, can easily be incorporated into the computation scheme. (Lang-USGS)

LABORATORY STUDIES OF STORM OVERFLOWS WITH UNSTEADY FLOW,
P. Ackers, A. J. M. Harrison, and A. J. Brewer.
Symp on Storm Sewage Overflows, May 1967.

Descriptors: *Storm runoff, *Overflow, *Weirs, *Stilling basins, *Model studies, Instrumentation, Water pollution, *Chemical analysis.
Identifiers: *Suspended solids.

Models of four types of typical overflows: (1) a low side weir, (2) a stilling pond, (3) a vortex with central spill, and (4) a storage overflow with high side weir, were tested at two pipe slopes, 1:500 and 1:100. The model overflows were installed in turn at the downstream end of the pipe. The salinities of the base flow, the spilled water and water passed to treatment were measured by electrical conductivity meters. Suspended and floating materials were introduced into the pipe by screw-feed injector, heavier material being put in by hand upstream. Solids were collected by sieves. The tests were divided into two categories: (a) those investigating the discharge of dissolved pollution and (b) those studying the behavior of bed load and suspended and floating solids. Each structure was first tested with saline-base flow and fresh-water storm waves of 1, 2, 3, and 4 mins. duration. Recorder charts were analyzed for each structure and the duration of each test in turn, to obtain the discharge time curves shown. The proportions of pollutants spilled to the wave duration are shown by graphs as well as the average concentrations of pollutants in the spill as proportions of a base flow concentration each for salt, polystyrene, bakelite, polythene, and polythene with scum boards.

PRELIMINARY GUIDANCE FOR THE CALCULATION AND DESIGN OF STORM-SEWAGE OVERFLOWS IN COMBINED SEWAGE SYSTEMS.

Abwassertechnische Vereinigung, 1962. 26 p.

Descriptors: *Overflow, Rainfall-runoff relationships, *Design.
Identifiers: Storm sewers, *Combined sewers.

Based on existing information on rainfall and runoff in sewerage systems, preliminary measures are suggested for the calculation and design of storm-sewage overflows by determining the critical intensity of rainfall at which an overflow first occurs, which is illustrated by nomograms. This method of calculation is not as straightforward as the existing dilution process but it has the advantage that predictions can be made on both the frequency of operation and the duration of the overflow. It is these criteria which determine the state of pollution in the receiving water and permit a uniform and even treatment of the storm-sewage overflow in a cross section of the channel. This confirms the usefulness of this method, since heavy rainfall in sewerage systems can be retained, thus reducing the polluting load on the receiving water.

COMPUTERS TO CONTROL COMBINED SEWERS.

Environ Sci Technol, Vol 1, No 10, p 777, Oct, 1967.

Descriptors: *Computer program, *Overflows, Storm runoff, *Automatic control, Sampling.
Identifiers: *Combined sewers, Urban drainage.

The Minneapolis-Saint Paul Sanitary District is working on a $1.7 million demonstration project to use a process control computer to control combined sewer overflows. When heavy rainfall causes the sewers to overflow, the excess is diverted into the river through gates in the sewers. The computer will be used to see that the most polluted flow goes to the treatment plant and the cleaner water to the river. The system will rely on data telemetered from 28 sampling stations to the computer at the plant. The data will include the amount of rainfall, sewer levels, and gate positions. Using simulation techniques, sewage plant operators can determine the best settings on control gates to get maximum pollution to the plant and minimum pollution to the river.

STORM-WATER OVERFLOWS FROM COMBINED SEWERS,
H. H. Benjes, P. D. Haney, and O. J. Schmidt.
J Water Poll Control Fed, Vol 33, p 12, 1961.

Descriptors: *Storm runoff, *Overflow, *Rainfall-runoff relationships.
Identifiers: *Combined sewers, Kansas City (Mo.), *Interceptor sewers.

Advocate using peak dry-weather flow rather than average dwf in determining a ratio for interceptor sewers. This helps decrease the per cent difference in peak to average DWF found because of size of community. Agreement with other investigators that from 0.03 to 0.04 in./hr is needed to wet down area before run-off. Each 0.01 in./hr will produce run-off equal to DWF. In Kansas City it was found that measurable rainfall occurred about 5 per cent of the time. Of this 3.7 per cent of the time run-off could occur. With a peak dwf of 1.5 x ave. dwf and a interceptor capacity of 1.5 x ave DWF it was found overflow would occur 3.72 percent time = to peak dwf. If interceptor was increased to 3.5 ave dwf, overflow would still occur 3.22 per cent of time and 6.5 x ave dwf 2.3 per cent of time. Authors conclude that the practical maximum effective capacity of interceptor can not be much larger than the peak dwf. Also recommend more work be done in characteristics of storm water runoff.

ESTIMATING THE CAPACITY OF SEWERS AND STORM DRAINS,
P. Ackers.
Munic Eng, London, Vol 142, p 170, 175, 1965.

Descriptors: *Sewers, *Storm drains, Pipes, Flow measurement, Slime.
Identifiers: *Capacity.

Recent investigations on sewer capacities, conducted at the Ministry of Technology, Hydraulics Research Station, are summarized. Experiments using clean, salt-glazed, precast concrete, and pitch-fibre pipes confirmed the validity of the Colebrook-White friction formula (but not the Crimp and Bruges or Manning equations), and also showed that pitch-fibre pipes, when clean, have an hydraulic capacity 5-10 per cent greater than the others. The effect of imperfect joints in salt-glazed pipes on the roughness coefficient was found to be directly related to the degree of eccentricity and the spacing of the joints. To investigate the effect of slime layers, flow-velocity measurements were made in 20 sewers of various ages, materials, sizes and gradients, and the roughness coefficients were calculated. The results, which are tabulated, indicate that slime layers form quite rapidly in sewers, and that the roughness factor increases with increasing thickness of the layer, giving a corresponding reduction in capacity.

PROVIDE DRAINAGE BEFORE FLOODS OCCUR.

Amer City, Vol 75, p 2, 1960.

Descriptors: *Storm runoff, *Water pollution, *Storm drainage, Pumping, Sewage treatment, Sewers.
Identifiers: *Storm sewers, *Urban drainage.

Present sewerage facilities serving the Counties of Macomb and Wayne, Michigan are grossly inadequate. The area is drained by Milk river which is very slow flowing and sometimes stagnant, and a rapid increase in population resulting in an increase in the volume of storm water has augmented the problem. A project to improve the sewerage facilities, started in September 1958, includes the construction of two pumping stations, a main pumping station with skimming and sedimentation tanks located about 3/4 mile upstream from the mouth of the Milk river and a low-lift pumping station about 1/2 mile downstream from the main pumping station. Radial gates have been installed in the river so that the water between the two stations can be changed when necessary. The new Milk river sewer, although designed primarily for storm water use, will carry a small quantity of sewage during storm periods. Under normal dry weather conditions all sewage is discharged to the Wayne County interceptor system and then to the Detroit sewage-treatment plant.

FLOOD RELIEF PROJECT IN LONDON SUBURB.

Civ Eng and Public Wks Rev, Vol 63, No 744, p 761, July 1968.

Descriptors: *Surface drainage, *Tunnels, *Construction, Manholes, *Velocity, Outlet, *Flood control.
Identifiers: *Sewer flushing, *London (Great Britain), *Storm sewers.

In an effort to relieve flooding in the London Borough of Redbridge a new system of surface sewers was constructed in a tunnel about 30 ft below ground level. Access shafts were constructed of 11 ft. internal dia. reinforced concrete bolted segments. On completion of tunnelling operations they were converted into drop-manholes to transfer the excess flow from the existing system down into the new tunnel system. In addition to the connections to the existing system it was necessary to include a number of drop-manholes in the scheme since it was felt that the gradients of the new sewers should be designed so that the velocity of flow would be kept below 12 ft. per second to prevent excessive abrasion of the tunnel by grit, etc. It was found that the amount of noise produced by the flow in the drop-manholes has been low and no complaints have been received even though the manholes are sited in the road outside residential property. The flow passes down a vertical cast iron pipe into a water cushion at the bottom of the shaft. The water cushions have proved successful since although there is a build up of grit and debris at low flows, at peak flows the debris is disturbed and flushed down the pipe to the outfall. The water cushions are designed in such a way that they will not choke up with debris during prolonged low flow conditions.

NEW SEWERAGE FOR CROYDON.

Civ Eng and Public Wks Rev, Vol 63, No 743, p 666, June 1968.

Descriptors: Sewers, *Tunnels, *Construction.
Identifiers: *Storm sewers, *Capacity.

The Borough of Croydon on the border of Surrey has been carrying out a program of new building including commercial development, which has raised a demand for additional sewage capacity. Accordingly, foul water and storm water sewerage has been laid down. The tunnel for the new sewer was sunk at a depth of 40 ft. below street level and was constructed of precast concrete segments. Tunnel diameters varied between 6 ft. and 7 ft. in the former, the foul water channel was of 24 in. dia. and of 27 in. dia. in the remainder.

FLOOD RELIEF SCHEME FOR WEST LONDON.

Survr, Vol 122, No 3728, p 1429, Nov 16, 1963.

Descriptors: Pumping, Storm runoff.
Identifiers: *Storm sewers, London (England).

Extensions to existing flood relief system in West London include Hammersmith storm relief sewer and pumping station; new station will contain 8 electrically driven 42-in.-diam pumps with total capacity of 1500 tons/min; just before pumping station, 6-ft and 2 8-ft sewers will combine into approach channel 24 ft wide and 120 ft long which will house penstocks and screens to protect pumps.
W69-01763

SURFACE WATER AND SUBSOIL DRAINAGE.
British Standards Institution, London, 1952.

Council for Codes of Practice for Buildings, British Standard Code of Practice CP 303, 1952.

Descriptors: *Storm drains, *Design, *Surface drainage, *Rainfall intensity.
Identifiers: *Storm sewers, Urban drainage, *Surface permeability, Storage tanks.

In this Code of Practice on drainage, recommendations are made for the collection and disposal of rain water and subsoil water, particularly by sewers and drains from small housing estates and individual dwellings. Factors to be considered in the design of surface-water drainage systems so that pipes are self-cleaning are the intensity and duration of rain fall and permeability of surfaces. Procedure is given for disposal of water in sewerage system or to soakaways, streams, or storage vessels. Subsoil water is defined as the portion of rainfall that is absorbed in the ground and its drainage is required to increase the stability of the surface and workability of soil and to reduce flooding. The laying of field drains and mole drains is dealt with in relation to local conditions.
W69-01765

A GUIDE FOR ENGINEERS TO THE DESIGN OF STORM SEWER SYSTEMS, PREFACED BY THE REPORT OF THE JOINT COMMITTEE ON RAINFALL AND RUN-OFF OF THE ROAD RESEARCH BOARD AND THE MINISTRY OF HOUSING AND LOCAL GOVERNMENT.

Dep Sci Indus Res, Road Res Lab, London, Road Note No 35, 1963.

Descriptors: *Design, *Hydrographs, *Hydraulic properties, Sewers, Pipes, Computer programs, *Runoff, *Rainfall intensity.
Identifiers: *Storm sewers, *Lloyd-Davies formula.

This publication is intended to guide engineers in the use of the 'rational' (Lloyd-Davies) formula and the Road Research Laboratory hydrograph method (see Wat. Pollut. Abstr., 1962, 35, Abstr. No. 2151) for designing storm sewage systems. The 'rational' formula is recommended for use in areas where the diameter of the largest sewer is unlikely to exceed 24 inches, while the R.R.L. hydrograph method is applicable to all areas. The calculations involved in the hydrograph method are carried out by means of an electronic digital computer. Data on rates of rainfall and the hydraulic characteristics of sewer pipes are included. The publication is prefaced with a report of the Joint Committee on Rainfall and Run-off of the Road Research Board and the Ministry of Housing and Local Government, dealing with origins of the research, constitution and terms of reference of the committee, and the work being carried out.
W69-01766

SMALL UNDERGROUND DRAINS AND SEWERS: I AND II.

Dept of Scientific and Indus Res, Build Res Sta, Dig Nos 124 and 125, 1959.

Descriptors: *Design, *Construction, *Sewers.

These Digests, which supersede Digest No. 55 (1953), contain advice on the design and construction of drains and sewers, revised on the basis of recent studies. Part I deals with structural design, and Part II with watertightness, flexible joints, site work, and testing.
W69-01767

STORM DRAINAGE SYSTEMS.
Navy Bureau of Yards and Docks, Washington, D. C., 1956.

Descriptors: *Storm drains, *Storm runoff, Subsurface drainage, *Design, *Construction, *Maintenance.

This revised publication presents in detail basic information on the design, construction and maintenance of storm drainage systems used at naval establishments in the U.S.A. and abroad. Although sub-surface drainage factors are presented, a subsurface system should be required only when excess water cannot be otherwise removed.
W69-01769

MANUAL FOR URBAN PLANNING - CHAPTER V: INDUSTRIAL LAND PLANNING,
J Byron Barber.
ASCE Proc, J Urban Planning Devel Div, Vol 93, No UP3, pp 1-13, Sept, 1967.

Descriptors: *Planning, *Drainage systems, Surface runoff, *Storm runoff.
Identifiers: *Urban drainage.

Two aspects of industrial land planning are presented: (1) The urban planner responsible for ascertaining amounts, kinds, and locations of industrial land in the general plan; and (2) the industrial land planner responsible for selection and formulation of a plan for a specific site for a manufacturing plant. It is emphasized that the principles, objectives, methods, and standards described herein apply to both aspects. Sewage problems are briefly discussed. Costs depend on the characteristics of the land and on the type of industry. Storm drainage and surface runoff should be separated from industrial and domestic wastes.
W69-01770

ECONOMICS OF URBAN DRAINAGE DESIGN,
W. J. Bauer.
ASCE Proc, J of Hydr Div, Vol 88, No HY6, pp 93-114, 1962.

Descriptors: Land use, Design storm, *Storm runoff.
Identifiers: *Urban drainage, *Storm sewers, *Chicago (Ill.), Capacity.

Problem of urban drainage viewed as one of space allocation. Storm sewers need a system of controlling location of volumes of water that occupy space in a watershed during and after periods of excessive rainfall. Principles are illustrated by application to Chicago Metropolitan Area during storm of July 1957. Idea of measuring performance of conveyance system in terms of dollars/cfs in transporting water is introduced and some sewer costs given. Planning criteria for urban drainage given: design storm, future urbanization, multiple-purpose projects, storm sewer capacity, assessing benefits, regulation of use of flood plain.
W69-01771

MANUAL ON URBAN PLANNING - CHAPTER III: RESIDENTIAL LAND PLANNING,
George C. Bestor.
ASCE Proc, J. Urban Planning Devel Div, Vol 93, No UP2, pp 27-92, June 1967. George C. Bestor and Assocs, Inc, Carmel, Calif.

Descriptors: *Planning, Land use, Storm drains, *Drainage systems, *Storm runoff.
Identifiers: *Urban drainage.

Residential land planning is going through an era of drastic change. The creation of a better living environment is a major challenge to planners. Engineers are needed as specialists supporting planning activities, and as qualified planners. Many concepts in planning are being increasingly employed, such as: clustering, density zoning, open space, recreational features. Careful consideration of economics is essential to a successful planning activity. No matter how well planned, a project can fail to obtain approval from sponsors or from governing authorities if it is poorly explained and presented. Storm drainage should be planned in the early stages of a project development. Several methods of dealing with stormwater are outlined.
W69-01772

STORM SEWER TUNNEL IN ST. PAUL,
J. W. Bird.
Civil Eng, Vol 33, pp 51-53, Sept 1963.

Descriptors: *Tunnels, Construction, Construction costs.
Identifiers: *Storm sewers, *St. Paul (Minn.), 'Mole' tunneling.

St. Paul's storm sewer tunnel involved building 4,800 ft. of 10-ft. tunnel with 12-in. walls and 1,200 ft. of 7-ft. tunnel and 900 ft. of 6-ft. tunnel with 9-

in. walls. The cost was $2,120,852. There are three 36-in. one 4-ft., and one 8-ft. dropshafts. Four 10-in. alignment holes were drilled to a depth of 70 ft. below the tunnel. These holes acted as inverted walls and were used to lower the water table and to provide construction needs. A 20-ft. long mechanical mole excavated a 12-ft., 3-in. opening for the 10-ft. tunnel. Excavated material was transported to a slurry box, mixed with water to constitute 20% solids, and pumped out. Dust problems were solved by a water-spray and air-exhaust system. Placing forms and pouring concrete closely followed the excavation. Only 110 to 200 ft. of unlined tunnel was permitted. A pneumatic concrete placing machine was replaced by a Pumpcrete machine that cut concrete placement time in half. Vibrators in the concrete plus some vibration in the forms gave excellent results.
W69-01773

TORONTO CONFRONTS OUTDATED SEWERS,
F. T. Booth, N. Vardin, and G. L. Ball.
Water Poll Control Fed J, Vol 39, No 9, p 1557, Sept 1967.

Descriptors: *Storm runoff, *Water pollution control, Construction, *Overflow, Highways.
Identifiers: *Combined sewers, Toronto (Canada), *Capacity, *Storm sewers.

Toronto's combined sewer system is inadequate to handle the flows generated by storms. A program to correct this problem is now under way. Separation of sanitary waste flows and drainage is required in all new buildings. It was determined that a stormwater capacity of about 1.5 times dry-weather flow provides substantial reduction in pollution from storm overflows without excessive cost. Construction of shallow storm sewers will be undertaken to first intercept road and other land runoff and later to receive separate drainage flows from buildings as redevelopment takes place. The proposed system ultimately will protect against the storm with a return period of one year.
W69-01774

THE MAUNGARAKI DEVELOPMENT,
R. G. Brickell.
New Zealand Eng, Vol 23, No 3, pp 95-100, March 15, 1968.

Descriptors: *Storm runoff, Flood control, Discharge (Water).
Identifiers: *Urban drainage, *Capacity.

A development of hilly land for housing in the Wellington area of New Zealand, known as the Maungaraki Development, is described. Problems arising from the development include finance, erosion control, compaction control, and removal of unsuitable materials. The disposal of stormwater runoff was complicated by the limitation of peak runoffs reaching the main storm-water system (the Western Hills culvert) to the capacity of the culvert. The problem was solved by the use in the two main valleys of flood control dams, which store the flood waters and let them discharge at a controlled rate. The ponds are carefully fenced off and are provided with 'leaks' at a low level, which ensure that they dry out a few days after rain. The second flood control dam, in Percy Creek, was constructed by the Petone Borough Council to a design prepared by Climie, Spencer, and Associates, consulting engineers to the Petone Borough Council.
W69-01775

RETENTION BASIN ELIMINATES NEED FOR COSTLY STORM SEWERS,
F. W. Crane.
Eng News Rec, Vol 143, No 25, pp 38-42, 1949.

Descriptors: *Flood control, *Storm runoff, Pumping.
Identifiers: *Storm sewers, Buffalo (N. Y.), *Storage tanks, Capacity.

To prevent flooding from overloaded storm sewers in Buffalo, New York, it is planned to store excess storm water in a disused quarry which has a capacity of 2,350,000 cu ft. The water will then be pumped gradually into the sewers and so discharged into the creek.
W69-01777

STORM WATER DETENTION IN URBAN AREAS,
Eugene J. Daily.
Pub Works, Vol 92, pp 146-147, Jan 1961.

Descriptors: Storm runoff, Drainage system.
Identifiers: *Urban drainage, *Storage tanks.

Give some cost estimates of savings in drainage systems by using detention basins.

DESIGN STORM HYETOGRAPHS FROM STUDIES OF RAINFALL IN THE WESTERN AREA OF SIERRA LEONE,
E. J. Davies, N. J. Garber, and A. E. Harleston.
J Inst of Water Engrs, Vol 20, No 1, pp 67-74, Feb 1966.

Descriptors: *Design storms, *Drainage systems, *Rainfall intensity, Design, Storm, *Hydraulic design.

In Sierra Leone, the design of stormwater drains, spillways, and similar structures whose geometric and hydraulic properties must be related to precipitation frequency, intensity, and duration has largely been based on conjectural storm characteristics. The object of the study was to produce predesign information applicable to the design of stormwater drains and similar structures.
W69-01779

DESIGN OF SURFACE-WATER SEWERS,
L. B. Escritt.
CR Books Ltd, London, 1964. 64 pp.

Descriptors: *Design.
Identifiers: *Storm sewers, Calculations.

In this monograph, which is largely based on a previous paper by Escritt, L. B., and Young, A. J. M., with modifications in the light of further research, recommendations are made for the economical design of surface-water sewers. After a critical review of previous practice, experience, and research, with particular reference to errors resulting in the considerable over-sizing of sewers, the theory is re-examined in the light of recent field studies, leading to the development of a simple, rapid, and accurate method for designing sewers of more economical sizes. Examples are given comparing the new method with the original Lloyd-Davies method. A list of references is provided.

MAIN DRAINAGE FOR SKELMERSDALE NEW TOWN,
D. H. Garside.
J Instn Munic Engrs, Vol 93, pp 26-27, 1966.

Descriptors: Sewers, *Hydrographs, Sewage treatment, Sewage effluent, Design.
Identifiers: *Combined sewers, *Sewer separation, *Storm sewers.

The sewerage system for Skelmersdale New Town, Lancs., has been designed on a separate system and, wherever possible, existing combined sewers will be replaced by separate foul and surface-water systems. After making a comparison between the Road Research Laboratory Hydrograph, and the Lloyd-Davies method of design for surface-water sewers, it was decided to adopt mainly the Lloyd Davies method, but the R. R. L. method was used to produce the hydrographs required for the design of the balancing lakes. There are three types of temporary treatment plant in use: one, a package type extended-aeration plant; the second, an extended-aeration plant using diffused air; and the third, a conventional filter plant using 'Flocor' medium. The final effluent is discharged to the river Tawd. A fourth plant is planned, in the event of further housing development or an increase in industrial flow; this will involve primary sedimentation, land treatment, and clarification of the final effluent through a gravel bed, and the effluent will be discharged to the river Tawd. The main sewage works which is being constructed will provide complete treatment by the activated-sludge process with Simear aeration cones, and the effluent will be discharged to the river Douglas.

MANUAL ON URBAN PLANNING - CHAPTER VI: COMMUNITY FACILITIES PLANNING,
Herbert A. Goetsch.
ASCE Proc, J Urban Planning Devel Div, Vol 93, No UP3, pp 15-42, Sept 1967.

Descriptors: Sewage treatment, *Flood control, *Planning, Storm runoff, *Drainage systems.
Identifiers: *Urban drainage.

Community facilities are those buildings, works and land areas which are devoted to public or semi-public uses. Included in this catagory are public works and utilities to provide water, power, heat, light, communications, sewage treatment, flood control, and transportation. In planning for community facilities, the urban planner must consider population characteristics and projections, present and future land use, local governmental structures, climate, topography, soil, and vegetation. He must consider a community's objectives and financial ability, as well as the standards of the using agencies. Community facilities may be provided by a local community alone, jointly by several units of government, by higher levels of government, by utility companies, and by private and semi-private agencies. These facilities should be planned jointly since their uses are often complementary and space can be conserved. Problems of flood control and stormwater drainage systems are discussed. Providing adequate stormwater drainage must be considered an important part of urban planning. Economic and engineering aspects of the problem are outlined.
W69-01787

CONSIDERATION OF STORAGE CAPACITY IN STORM-WATER SEWERS,
J. F. Gruhler.
Gesundheits-Ing, Vol 84, 1963.

Descriptors: Design, *Instrumentation, *Flood control, *Storm runoff.
Identifiers: *Storm sewers, Capacity.

The author describes the design of a storm-water sewer equipped with special throttles which can be arranged so as to use the total storage capacity of the sewer and at the same time control the volume of storm water leaving the system to avoid flooding. The exact position and size of these throttles must be determined experimentally, since there is at present no known method for calculating them. The principle of the design is based on the establishment of equilibrium conditions, the flow of storm water entering the system being equal to the storage capacity of the system minus the storm water leaving it, and this depends on the sewer being filled to a certain depth.
W69-01788

ON-THE-SPOT TESTS CHECK GUTTER CAPACITY,
G. H. Hamlin, and J. Bautista.
Am City, Vol 80, No 4, pp 94-6, April 1965.

Descriptors: Flow measurement, *Surface runoff, *Overflow, Design storm, *Inlets.
Identifiers: *Street gutters, *Capacity.

Water-carrying capacity of street gutters in San Leandro, Calif was tested and it was found that practical flows are 1/2 to 1/4 of maximum calculated flows; measurements show that overflows occur substantially below maximums found in tables or calculated by formula; overflows are caused by vehicles parked at curb and driveway openings; tests also measured curb inlet and grating performance; catchbasins are now installed wherever design-storm flow reaches half-way up vertical curb face on all street grades up to 5%.

THE USE OF LAKES IN CONNECTION WITH SEWAGE DISPOSAL,
L. B. Escritt.
Water Waste Treatment J, Vol 7, 1959.

Descriptors: *Surface runoff, *Storm runoff, Outlets, *Flow control, *Lakes, Sewage treatment.
Identifiers: *Capacity, Great Britain.

The author discusses the discharge of partially-treated sewage and of storm water to lakes. Experiences in various countries are quoted, and it is concluded that, with reasonable precautions, lakes could be used in England for the storage of surface run-off without causing nuisance. The design and installation of a module to regulate the outflow from the storage lake to a stream is discussed, and a method and formulae are given for calculating the required storage capacity of a lake in terms of the frequency of storm and rate of outflow from storage.

AQUIFER RECHARGING,
L. T. Hunziker.
Wat Sewage Works, Vol 111, pp 203-205, 1964.

Descriptors: *Groundwater recharge, *Storm runoff, Water pollution.

In a review of recharging of aquifers, various methods are described including diffusion wells and seepage lagoons using settled storm water. The quality of the water for recharge, geological conditions and the dangers of pollution are discussed briefly.
W69-01826

SLUDGE DEPOSITS IN STREAMS FROM STORM WATER OUTLETS,
W. Kiefer.
Neue Deliwa Z, Vol 3, p 71, 1959.

Descriptors: *Storm runoff, *Overflows, *Sewage sludge, Waste dilution.
Identifiers: *Combined sewers, Storage tanks.

The author describes by means of an example a method for estimating the effect of storm-water overflows on sludge deposits in streams. From comparison of overflows of different types it appears that overflows from combined sewerage systems with five-fold dilution add, on a yearly average, less load to the stream than separate systems. Use of storm-water sedimentation tanks, the ideal solution, is not always possible. In general it is unnecessary for such tanks to have a retention period of more than 10 min. The self-purifying power of the stream must be taken into consideration.
W69-01830

OVERFLOWS FROM COMBINED SEWERS IN WASHINGTON, D C,
G. J. Moorehead.
J Water Poll Control Fed, Vol 33, 711, 1961.

Descriptors: *Overflow, *Storm runoff, Estuaries.
Identifiers: *Combined sewers, *Sewer separation, *Washington, D.C., Potomac River.

The older part of Washington, D.C. is served by a combined sewerage system which discharges a mixture of sanitary sewage and storm water into local streams and the Potomac river during each nominal rainfall, while overflows of sanitary sewage sometimes occur during hot dry weather. After a review of the development of the sewerage system, the author outlines a study which was carried out recently to determine the percentage of sanitary sewage flow which is discharged through storm-water overflows. As a result of the study it is planned to provide some separation of sanitary and storm-water sewers, with the majority of the existing storm-water overflows on the combined system remaining in limited acceptable service. This is expected to reduce the amount of sanitary sewage discharging to the watercourses in the area from 3.3 percent to 0.4 percent of the total flow.
W69-01839

THE PERMISSIBLE DILUTION AT STORM WATER OUTLETS,
W. Scharfe.
Wasserw--Wass Techn, Vol 5, p 243, 1955.

Descriptors: *Storm runoff, *Overflow, Outlets, Construction, Water pollution.
Identifiers: *Dilution, Storage tanks.

The author points out that a dilution ratio for storm water overflows of 1:7 may not in all circumstances afford protection to the stream. Local rainfall, by stirring up deposits, may result in the discharge of a liquid more concentrated than normal sewage. Special attention must be paid to the construction of the outlets and to the provision of retention tanks. Increasing the ratio would give sewers of uneconomic size.
W69-01853

BALANCING TANKS AND POUNDS IN THE SURFACE WATER DRAINAGE SYSTEM OF HEMEL HEMPSTEAD,
T. H. Carden.
J Inst Munic Engrs, Vol 93, pp 24-25, 1966.

Descriptors: *Surface drainage, *Drainage systems, *Discharge (Water), *Automatic control.
Identifiers: *Storage tanks, *Urban drainage, Capacity.

The author describes further improvements to the new surface-water drainage system already in operation in Hemel Hempstead, Herts. A further pound is under construction to deal with run-off from one of the new development areas and discharge to the river Gade will be regulated by automatic switches; a further balancing tank is also under construction in the Ver catchment area, with a capacity of 1 1/2 mil.ft3. The balancing tanks and their functions are described and it is suggested that considerable saving can be achieved by the use of a storage unit in suitable drainage schemes where existing facilities for disposal are inadequate.

URBAN HYDROLOGY - REDIRECTION,
D. Earle Jones.
Civil Eng - ASCE, Vol 37, No 8, pp 58-62, Aug, 1967.

Descriptors: *Drainage systems, Storm runoff, *Land use.
Identifiers: *Urban hydrology, *Urban drainage.

Inaccuracies of present hydrology methods are outlined. An improvement is suggested wherein the fact that cities have two separate and distinct storm water drainage systems, a 'minor' and a 'major' system would be recognized. The minor system consists of carefully designed closed and open conduits and their appurtenances. The major system is the route followed by flood or runoff waters when the minor system is inoperable or inadequate. Cities today are overdesigning the minor systems. A reasonable design would provide that ordinary vehicular access to properties be impaired no more often than once in 2-10 yrs. Wiser use of natural land conditions when developing the land can obviate extensive storm sewer construction. Examples are given of some methods for this wiser use e.g. 'blue-green' land development employing ponds with open space for storm-flow detention.
W69-01885

STORM RUN-OFF FROM URBAN AREAS,
M. V. King.
Proc Insts Civ Engrs, Vol 37, pp 43-56, Pap No 6996, 1967.

Descriptors: *Storm runoff, Rainfall-runoff relationships, *Sewers, Hydrographs, Drainage systems, Design.
Identifiers: Urban drainage, *Urban hydrology, Surface permeability.

The author describes the development of a mathematical relation between rainfall and run-off in urban areas, taking into account various calculable characteristics of a drainage area and the retention action of a sewerage system as used in the Road Research Laboratory hydrographic method. It is shown that the peak flow for any particular frequency of storm depends on the time of concentration, the effective impervious area, and the total volume of water in the sewerage system at the time of peak run-off; only the last of these is difficult to determine, and for very large areas it is considered adequate to use an approximation. Having determined the retention constant for a drainage system

under particular conditions, it is also possible to draw the complete run-off hydrograph. This method may be used in designing large sewers, but is not considered suitable for small ones.

THE DESIGN OF URBAN SEWER SYSTEMS. RESEARCH INTO THE RELATION BETWEEN RATE OF RAINFALL AND THE RATE OF FLOW IN SEWERS,
L. H. Watkins.
D S I R Road Res Tech Pap No 55, London, 1962.

Descriptors: *Design, Sewers, *Rainfall-runoff relationships, Runoff, *Instrumentation, Storms, *Hydrographs, *Computer programs.
Identifiers: *Urban drainage, *Surface permeability.

A report is given of research carried out by the Road Research Laboratory on the relation between the rate of rainfall and the rate of run-off from urban areas, principally intended to lead to a method for calculating the rate of run-off in sewerage systems that would be accurate and reliable under as wide a range of conditions as possible. Rainfall and run-off were recorded at 12 experimental catchment areas, representing a wide range of sizes, types of development, locality, and other variables; and the rates of run-off calculated from the recorded rates of rainfall by 5 different methods were compared with the recorded rates of run-off. Descriptions are included of the experimental catchment areas and of new recording instruments which were developed for use in these investigations. A total of 286 storms was analysed and it was concluded that the Rational (Lloyd-Davies), Tangent, and Modified Tangent methods for calculating run-off were unreliable for use in the design of sewerage systems, although the Rational method could be used for relatively small areas, such as housing estates and villages, where there are no sewers larger than about 24 inches in diameter. The usual Unit Hydrograph method was also unsuitable for the design of urban sewerage systems owing to difficulties in determining the shape of the unit hydrographs. The Road Research Laboratory therefore devised a new hydrograph method which is reliable under all conditions and will be used in conjunction with an electronic digital computer. It was also concluded that in calculations for the design of sewers, subject to some qualifications in exceptional circumstances, the whole area of paved surface in an urban area should be considered impermeable, and the unpaved areas should be considered completely pervious.
W69-01905

A METHOD OF URBAN DRAINAGE DESIGN FOR REGIONS OF HIGH RAINFALL INTENSITY,
I. R. Wood.
Civ Eng Trans Instn Engrs, Australia, CE1, No 1, p 38, 1959.

Descriptors: *Rainfall intensity, *Design, *Drainage system, *Storm runoff, Design storm, *Hydrographs.
Identifiers: Urban drainage, *Surface permeability.

The author considers that the Rational Method is unsuitable for the design of suburban drainage systems in regions where the design intensity is so high that run-off occurs not only from the impervious area but also from the pervious area, such as lawns and gardens. He suggests that a better method would be to determine a design storm pattern, subtract a loss rate curve, and translate the excess rain into hydrograph form using overland flow equations. The application of the method to conditions in Canberra is described. Approximations are suggested to make it possible to use the procedure for routine design.
W69-01910

HARVARD GULCH FLOOD CONTROL PROJECT,
K. R. Wright.
ASCE-Proc (J Irrigation and Drainage Div), Vol 93, No IR1, paper 5132, pp 15-32, March 1967.

Descriptors: *Flood control, *Model studies, Intakes, *Design, Construction.
Identifiers: *Urban hydrology.

Planning, design, and construction of major urban flood control project is presented; emplasis is placed on flood hydrology investigations used as basis for sizing of culverts, open channels, and structures; information is given on model testing of inlet structure to assure control of rate of flood waters entering outfall culvert; techniques for designing open channels, both concrete and grass-lined, are described; underflow pipes were used to carry normal low flows; planning of construction schedule by design engineer is described, together with methods of construction and results of alternate bids for large diameter concrete pipe and concrete box culvert.

KRUPA V FARMINGTON RIVER POWER CO (FLOODING BELOW DAM).

147 Conn 153, 157 A 2d 914 (1959).

Descriptors: Dikes, *Flood damage, Dam construction, *Dam failure, Building codes, Historic flood, Dams, Maximum probable flood, Rainfall-runoff relationships, Watersheds (Basins), Permits, Legal aspects, Floods, *Connecticut, Judicial decisions.
Identifiers: Farmington River, Flashboards.

Plaintiffs owned a farm on the Farmington River about 800 feet below defendant's dam. The farm was extensively damaged when a dike and flashboards which the defendant maintained in conjunction with the dam gave way during the disasterous floods of August, 1955. Plaintiffs based their cause of action in negligence, breach of contract, and nuisance. Defendant had not acquired proper state authorization to build the dam in 1925, but this violation of statute was not actionable because it was not shown to be the proximate cause of the injury. In 1950 the state board for the supervision of dams and dikes did approve of alterations to the headworks and the dikes. There was no error in the lower court's conclusion that the damage was not

caused by any negligence of the defendant but by an act of God. (McDermott-Fla)
W69-01927

TURNER V WASHINGTON SUBURBAN SANITARY COMMISSION (EASEMENTS AND DISCHARGE OF SURFACE WATERS).

221 Md 494, 158 A 2d 125.

Descriptors: Judicial decisions, *Maryland, *Easements, *Surface runoff, Surface drainage, Water injury, Storm drains, Sewers.

Plaintiff owned property over which a public highway ran, pursuant to an easement. The easement was granted when the area was rural in nature. When the area became suburban, the county built a sanitary sewer and storm drainage system along the highway. Plaintiff brought suit, claiming damages and injunctive relief, on the grounds that the sanitary sewer constituted an additional compensable servitude and that the storm drain concentrated and increased the flow of surface water onto his property, leaving silt and debris deposits. The court held that the laying of the sanitary sewer was within the original easement, and no compensation was necessary. However, the increased discharge of surface water, above the natural flow, was clearly actionable, and the trial court should have granted injunctive relief. (Williams-Fla)
W69-01928

JONES V DES MOINES AND MISSISSIPPI RIVER LEVEE DIST NO 1 (LEVEE DISTRICT'S LIABILITY FOR OVERFLOW).
369 S W 2d 865-869 (Ct App Mo 1963).

Descriptors: Natural streams, *Missouri, *Levees, Drainage systems, *Drainage districts, Pumping plants, Legal aspects, Boundaries (Property), Flooding, Seepage, Surface runoff, Standing waters, Overflow, Soil structures, *Ditches, Mississippi River.
Identifiers: Slough, Levee district.

The plaintiff, owner of property lying adjacent to and in a slough, filed suit against the defendant levee district for damages caused to his land by flooding and an injunction to prevent water from standing thereon. He contended that the district had no right to drain surface water from the surrounding area into the slough and should therefore be held liable for the resulting damage. The trial court denied relief. On appeal it was held, as to the land lying within the slough, that the evidence established that the slough was a natural watercourse thereby entitling the district to collect surface waters and to allow them to flow into that natural draining channel where they would otherwise naturally go. It was further held, as to the plaintiff's property lying outside the slough, that no evidence had been presented to show that the overflows complained of were caused by the defendant's levee. To the contrary, it was established that the water would have overflowed plaintiff's land more often had it not been for the defendant's pumps and levee. (Geraghty-Fla)

EXTINGUISHMENT BY PRESCRIPTION OF NATURAL SERVITUDE FOR DRAINAGE OF SURFACE WATERS,
L. C. Warden.
22 A L R 2d 1047-1059.

Descriptors: *Prescriptive rights, *Surface drainage, Drainage water, Easements, Legal aspects, *Obstruction to flow, Barriers, Natural flow doctrine, Land tenure.
Identifiers: *Servitude.

The right to be free from drainage or natural flow of surface waters may be acquired by prescription. Once the prescriptive right to obstruct the natural flow of water has been acquired, the height of the obstruction may not be increased over the height of the original obstruction. The taker of a prescriptive right to obstruct the drainage of water must benefit from the result. To extinguish a servitude for drainage of surface waters by prescription, there must be an adverse use by the servient tenement against the owner of the dominant tenement. The prescriptive period does not begin until a right of action arises, but no actual damage need be shown for extinguishment of servitude by prescription when the obstruction of the flow is on the servient tenement, the dominant owner must know about the adverse use. The obstruction must also be continuous and uninterrupted. One claiming extinguishment of servitude by prescription has the burden of proving it. (Sisserson-Fla)

SEC 5E TO ISSUE LICENSE FOR APPLICATION OF CHEMICALS TO WATERS FOR CONTROL OF AQUATIC NUISANCES, ETC. SEC 5F TO CONTROL ALGAE, WEEDS AND AQUATIC NUISANCES IN CERTAIN BODIES OF WATER, ETC.

Mass Ann Laws ch 111 Secs 5E, 5F (1967).

Descriptors: *Massachusetts, *Legislation, Administrative agencies, Plant growth regulators, *Chemicals, Algae control, Weed control, *Aquatic weed control, Nuisance algae, Permits, Ponds, Public health.

Sec 5E provides that no person shall use chemicals in a body of water to control algae, weeds or other aquatic nuisances without first obtaining a license from the Department of Public Health. Such license is valid for two years and may be renewed. It is not transferable or assignable and may be revoked for cause. A board of review is created to hear appeals from decisions of the Department. The Department is authorized to establish rules and regulations for the issuance of such licenses. A penalty is provided for violation of the act. Public employees and owners of private ponds are exempted from the act. Sec 5F authorizes the Department of Public Health to control weeds and algae in such bodies of water as it deems necessary. Public hearings and cost estimates are established to determine the necessity of such projects. (Williams-Fla)
W69-01937

WESTBURY REALTY CORP V LANCASTER SHOPPING CENTER, INC (ARTIFICIAL USE OF LAND GIVES RESPONSIBILITY FOR INCREASED SURFACE WATER FLOW).
396 Pa 383, 152 A 2d 669-672 (1959).

Descriptors: *Pennsylvania, Judicial decisions, *Surface drainage, *Surface runoff, Reasonable use, Natural streams, *Land development, Rural areas, Land tenure, Developed waters.
Identifiers: Water disposal system.

Appellee was a developer of a shopping center. Appellant was a landowner whose property adjoined appellee's land. Appellant brought an action for damages resulting from an increased discharge of surface water from appellee's land, and to enjoin appellees from disposing of such water and to provide an adequate disposal system. A landowner may increase the flow of surface water through a natural waterway as a result of reasonable improvements to his land. The court held that covering 17 acres of land with non-porous materials was an artificial use of the land, and the developers had to take precautions so as not to place the burden of the increased flow of surface waters on adjacent landowners. (Sisserson-Fla)

ROCKWELL V STATE (HIGHWAY DRAINAGE).

182 NYS 2d 422 (Ct Cl 1959).

Descriptors: *New York, *Highways, Judicial decisions, Surface waters, Drainage, *Surface runoff, Drainage effects, State governments, Road banks, Pipes, Surface drainage, *Culverts, Damages.
Identifiers: Highway drainage.

A state highway, which perpendicularly intersects claimant's barn driveway, was resurfaced and claimant was required to remove a drain culvert which was underneath his driveway at the point of intersection. Because of the removal of the culvert, surface water flowing along a shoulder depression of the highway flows into claimants land and is causing damage to his barn. A state engineer testified that the highway was properly constructed. Claimant's expert testified that the state should have installed a pipe under the driveway to carry the drainage along the highway depression. A state is not liable for damage caused by the discharge of surface water which is the result solely of the grading of streets. However, if the state collects surface water into a single channel causing it to overflow onto adjacent land, the owner has a cause of action. Claimant could not recover because the natural topography of the land was responsible for the flow of water onto his land. The proof was insufficient to show that the state had increased the flow onto the land by artificial means. (Molica-Fla)
W69-01941

NOLAN V CARR (MUNICIPALITY'S LIABILITY FOR SURFACE DRAINAGE).

189 N Y S 2d 82-87 (Sup Ct 1959).

Descriptors: *Cities, *Riparian rights, Controlled drainage, Culverts, Roads, *Surface drainage, Remedies, Legal aspects, Judicial decisions, Ditches, Drainage system, *New York.

Plaintiff filed suit to restrain defendant town from maintaining a roadside drainage system which plaintiff alleged had produced a flooded condition and a deposit of soil and dirt on his land. Evidence presented at trial established that plaintiff's farm was located at the bottom of a natural depression and that surface waters from lands lying north, west and east of it would flow upon his land and collect in pools. Construction of the roadway and drainage system on higher land north of plaintiff's premises was found not to have increased the size of that natural watershed. It did, however, have the effect of collecting and discharging the water in mass which otherwise would have flowed in a diffused state upon the plaintiff's land. The mass discharge of collected surface water by a municipality onto a private owner's land is actionable. Liability, however, is not predicated on the mere discharge in a single point but on proof of damage to the owner's land. The court found the plaintiff had failed to prove damage to his land and that the drainage system did not increase the total amount of water which would ordinarily have flowed onto his land. Furthermore, the existence of a culvert under the road, terminating 12 feet from the plaintiff's land, provided opportunity for the diffusion of the water. The injunction was denied. (Geraghty-Fla)
W69-01942

HOLBROOK V MASSACHUSETTS TURNPIKE AUTHORITY (ACTIONS FOR DAMAGES BY LANDOWNER FOR FLOODING CAUSED BY FILLING LAND TAKEN BY EMINENT DOMAIN).
154 NE 2d 605-611 (Mass 1958).

Descriptors: Judicial decisions, *Massachusetts, *Eminent domain, Flooding, Landfills, *Flood damage, Rain water, *Highways, Administrative agencies, Damages, Ponds, Dams, Pipes, Legislation, Overflow.

Landowner brought a proceeding against the turnpike authority, which had taken part of his land by eminent domain for the construction of a turnpike, to recover for damage to his land as a result of flooding. The flooding occurred after very heavy rainstorms, allegedly because of fill dumped by a

contractor working on the turnpike. The Supreme Court held that the landowner could maintain a proceeding to recover for the damage under the statute creating the turnpike authority, if the damage was due to the performance of the work as authorized, but not if the damage was a result of an act of God, or due to the contractor's negligence or other unauthorized acts or omissions, in which case the landowner was required to seek redress in a tort action. The burden of proof was on the landowner to prove by a fair weight of credible evidence that his land was damaged or destroyed in the carrying out or in the exercise of powers granted the turnpike authority by statute. BLUMER V WISCONSIN RIVER POWER CO. (LANDOWNER'S SUIT AGAINST DOWNSTREAM DAM OWNER FOR RAISING THE WATER TABLE).
6 Wis 2d 138, 94 N W 2d 149-154 (1959).

Descriptors: Judicial decisions, *Wisconsin, *Dams, *Water table, Moisture content, *Damages, Riparian land, Reservoirs, Downstream, Flooding mosquitoes.

The Supreme Court of Wisconsin affirmed the lower court's decision that the power company was liable for damages to the plaintiff's land caused by the raising of the water table through the operation of a dam. Testimony of laymen who had been familiar with the condition of the property for many years was sufficient to support a finding that the water table had been raised by the defendant's dam and pool. The amount of damages awarded by the trial court could not be changed by the appellant court. The plaintiffs' only choice of getting more damages would be through a new trial, and they did not ask for a new trial. (Watson-Fla)

WISEMAN V TOMRICH CONSTRUCTION CO (ACTION FOR DAMAGES FROM WRONGFUL DIVERSION OF SURFACE WATERS THROUGH STORM DRAIN).
250 N C 521, 109 S E 2d 248-253 (1959).

Descriptors: *North Carolina, Judicial decisions, *Diversion, Natural flow doctrine, Conduits, *Surface waters, Cities, Road construction, Road design, Roads, *Storm drains, Surface runoff, Damages, Abatement, Drainage systems, Pipes.

Defendant developed a subdivision on land adjoining the plaintiffs'. One of the storm drains from a street in the subdivision wrongfully diverted the natural flow of surface water onto the plaintiffs land causing damage. The trial court awarded the plaintiff's damages and the appellate court affirmed. The court stated that because the construction company had built houses, sold lots, and dedicated streets to public use the rights of individual homeowners and the public had intervened to such an extent that the remedy of abatement was not available to the plaintiffs. The court also stated the development of the subdivision including the installation of the storm drain constituted a single wrongful act creating a permanent condition. The acceptance by the city of the street did not constitute a wrongful act, and the plaintiffs' only action available was against the construction company. The fact that the subdivision was developed under the supervision and in accordance with the requirements of the city did not effect the liability. (Watson-Fla)

LETTERMAN V ENGLISH MICA CO. (FLOODING ABOVE DAM).
249 N C 6769, 107 S E 2d 753-757 (1959).

Descriptors: *North Carolina, *Flood damage, Legal aspects, Floods, *Dams, Watercourses, Backwater, Soils, *Operation and maintenance, Sediment control, River bed, Mining, Mine wastes, Mine drainage, Ponds, Easements, Judicial decisions, Silting beds.
Identifiers: Toe River, Still water.

Plaintiff owned land fronting on the North Toe River about one-half mile upstream from defendant's dam. Drainage to plaintiff's land and roadways allegedly resulted when dirt dumped into the river in the course of upstream mining operations flowed downstream to the still water of the dam, raised the bed of the stream, and caused water to back onto plaintiff's property. Plaintiff grounded his cause of action in trespass and negligence, joining the upstream mine owner and the downstream dam owner. Defendant dam owner's demurrer was sustained and plaintiff appealed. This court affirmed. The proprietor of a dam, though not an insurer of the safety thereof, is required to exercise ordinary care in maintenance and operation so as to avoid injury to others occasioned by causes reasonably to be anticipated and guarded against. However, Plaintiff failed to allege sufficient facts to show that the injuries sustained were directly and proximately caused by any act or emission of the defendant. (Bozarth-Fla)

CORRINGTON V KALICAK (LIABILITY FOR CAUSING FLOOD BY OBSTRUCTING A STREAM).

319 S W 2d 888-895 (Ct App Mo 1959).

Descriptors: *Missouri, Judicial decisions, Legal aspects, Streams, *Obstruction to flow, Flooding, *Flood damage, Flash floods, Cities, Bridges, *Excessive precipitation.

Plaintiffs brought suit for damages allegedly caused by a city and a company with which it contracted to build a bridge. In connection with this project, the company had erected scaffolding in the watercourse over which the bridge was to be built. During a heavy rain, logs and debris collected against the scaffolding, causing the stream to overflow and damage plaintiffs' property. On appeal, the St. Louis Court of Appeals held that the damage was caused by the obstruction and not by an Act of God. The court held that the fact that the bridge's construction was a public work would not excuse a trespass committed in the course of the work. This was misfeasance within the course of the city's powers, and therefore it could be held liable in an action for trespass for direct injury, regardless of whether it was intentional or negligent injury. ANDERSON V U S (CLAIM FOR DAMAGES TO FARM LANDS ALLEGEDLY CAUSED BY ESTABLISHMENT OF WILDLIFE REFUGES).
174 F Supp 945-949 (Ct cl 1959) 5 p.

Descriptors: Judicial decisions, *Federal government, Damages, *Flood damage, Administrative agencies, Wildlife management, Rain, Migratory birds, Topography, Snow, *Natural flow doctrine, Drainage, Runoff, Watersheds (Basins), *North Dakota.

This was an action by owners and farm operators of land involved for damages for losses from flooding which they said was the result of activities of the Fish and Wildlife Service. The service obtained easements and flooded some of the low areas adjacent to the land in question for migratory wildlife refuges. The court stated that one could not lawfully divert water from its natural watershed or by artificial structures cause water to flow in another direction or over lands on which it would not otherwise have gone if to do so would deprive a landowner of the use or fruits of his property. However, the court added that it was necessary to prove that any damage suffered was the direct result of the activities complained of and there is no liability for damages caused by flooding which would have occurred regardless. The court held that the evidence presented established that the flooding of the land was caused by adverse weather conditions, topography of the area, and inadequate outlets for the lake rather than as a result of the activities of the Fish and Wildlife Service. ATTORAM REALTY CORP V TOWN AND COUNTRY BUILDERS, INC (DAMAGE FROM DISCHARGING SURFACE WATERS).
8 App Div 2d 936, 190 NYS 2d 499-501 (1959).

Descriptors: *New York, Judicial decisions, Appeals, *Drainage, Gutters, Rain water, *Surface runoff, Precipitation excess, Discharge, *Damages, Erosion, Gullies.

Town and Country Builders, appellants, contest a judgment (1) enjoining them from collecting surface waters on their land and discharging such waters onto respondent's land; and (2) awarding respondent money damages. Appellants, in connection with developing their land, built an 18-inch drain and two 21-inch drains to drain excess rain

water from their land. Respondent claimed that the increased flow caused by these drains resulted in forming gullies on its property. The judgment was reversed, without costs, to ascertain the damage to respondent's land from the difference in the value of the land before and after the installation of the drains, and to provide injunctive relief if the damages awarded are not paid within a reasonable time. The court found that a mandatory injunction would be oppressive. The measure of damages was changed, because the lower court's finding that the gullies were caused solely by the drains was against the weight of the evidence. (Childs-Fla)
W69-01995

GAGNER V CARLSON (RIGHTS APPURTENANT TO FLOWAGE EASEMENT).
150 A 2d 302-308 (1959) 146 Conn 288.

Descriptors: Judicial decisions, *Connecticut, *Easements, Ponds, Beds, Recreation, Dams, Flooding.

A portion of plaintiff's land which abutted a large pond was subject to an easement which allowed defendant to raise the height of a dam on plaintiff's property and to flood the surrounding land. Defendant obtained an injunction against interference by the plaintiff with his use and enjoyment of the pond for recreation and also against interference with his entrance on plaintiff's property to repair a break in the bank of the pond. Defendant's right to enter plaintiff's land for the repairs arises by implication from the grant of the easement because it is necessary for the full enjoyment of the easement, even though the break occured on land not subject to the easement. The easement was acquired by grant and not by prescription and contains no language limiting its purpose. Therefore it is broad enough to permit the defendant to make any reasonable use of the land to which the easement is appurtenant including recreation. (Molica-Fla)

4B. Groundwater Management

FIELD OBSERVATIONS COMPARED WITH DUPUIT-FORCHHEIMER THEORY FOR MOUND HEIGHTS UNDER A RECHARGE BASIN,
Agricultural Research Service, Fresno, Calif.
W. C. Bianchi, and E. E. Haskell, Jr.
Water Resources Res, Vol 4, No 5, pp 1049-1057, Oct 1968. 9 p, 4 fig, 5 tab, 16 ref.

Descriptors: Hydrographs, *Pit recharge, *Water level fluctuations, *Mathematical studies, *Dupuit-Forchheimer theory, Infiltration, Observation wells, Water levels.
Identifiers: Groundwater mounds.

A theoretical analysis, using the Dupuit-Forchheimer assumptions, of rising and falling hydrographs of the groundwater mound beneath the center of square and circular recharge basins, is presented. The analysis was field tested using 2-acre square ponds in Panoche clayloam. Observation wells were arrayed radially along the perpendicular bisectors of the sides of the ponds. The analysis was found to be generally acceptable. Discrepencies between calculated and observed values are due to imprecision in measuring or estimating physical parameters. (Knapp-USGS)

EXPERIMENTS IN WATER SPREADING AT NEWARK, DELAWARE,
D. H. Boggess, and D. R. Rima.
U S Geol Surv Water Supply Pap 1594-B.

Descriptors: *Storm runoff, *Groundwater recharge.
Identifiers: Surface permeability, Newark (Del).

Results are given of further experiments at Newark, Del., on the possibility of using excess storm run-off to recharge ground water (see Wat. Pollut. Abstr., 1961, 34, Abstr. No. 761). Although nearly 500,000 gal of water were spread in an infiltration ditch near the municipal well field and allowed to seep into the sub-surface, there was no indication that any appreciable amount of water reached the producing aquifer. Instead, a perched zone of saturation was created by the presence of an impermeable or slightly permeable bed above the water table. This layer barred the downward movement of water so effectively that in less than one day the apex of the perched zone rose about 10 ft to the level of the bottom of the infiltration ditch, and as more water was added the mound of saturation spread laterally. From these experiments it was concluded that the principal aquifer at Newark would not be benefited by spreading water in shallow infiltration ditches or basins, although the absorptive capacity of the unsaturated materials which occur at shallow depth is sufficient to permit the disposal of large volumes of storm water. However, the well field might be recharged by other methods; one possible solution would be a shallow basin to store excess storm water both of the land surface and in the permeable beds at shallow depth, and within this basin recharge shafts could be constructed to expose the top of the producing aquifer and allow water from the surface and from the sand and gravel bed to infiltrate through the shaft and into the aquifer below.

SARGENT V GAGNE (EASEMENT TO USE OF WATER SUPPLY ON THE LAND OF ANOTHER).

147 A 2d 892-901 (Vt 1958).

Descriptors: Judicial decisions, *Vermont, *Springs, Aqueducts, Pipelines, *Easements, *Water supply.

Both parties claimed ownership of a spring on the defendant's property. The court established that the spring belonged to the plaintiff through a deed to his predecessors many years previous. The defendants were enjoined from interfering with the plaintiffs' right to take water from the spring and from interfering with plaintiffs' repair and maintenence of a pipeline from the spring. The court held that the exception of the spring in the grant from the common grantor to the defendants' predecessor in title had the legal effect of carving out and separating the spring from the defendants' farm. The fact that the deed from the defendants' immediate grantors failed to mention such exception did not enlarge the defendants right to the spring. Defendants also had the burden of proving any abandonment of the easement, which they failed to satisfy. (Watson-Fla)

4C. Effects on Water OF Man's Non-Water Activities

EVALUATION OF THE EFFECT OF MINING THE IRON ORE DEPOSITS OF THE KURSK MAGNETIC ANOMALY ON THE FLOW REGIME OF THE OSKOLETS RIVER,
B. M. Dobroumov, I. N. Obraztsov, and B. S. Ustyuzhanin.
Translation from Trudy Gos Gidrol Inst No. 139, 1967, pp 206-223. Soviet Hydrol, Selec Pap No 1, pp 42-56, 1967. 15 p, 5 fig, 8 tab, 2 ref.

Descriptors: *Mine water, *River flow, *Surface-groundwater relationships, *Mine drainage, *Hydrologic budget, Water balance, Infiltration, Induced infiltration, Dewatering, Diversion structures, Waste water disposal.
Identifiers: *Water management measures, USSR, Oskolets River Basin, Chern' River Basin.

The effect on river flow of large-scale pumping for water control in deep iron mines in the USSR is described. In the area of the Mikhaylov iron mine in the Chern' River Basin, mined since 1960, the 1964 water-level depression reached 60m, the cone of depression had a radius of 18 km, and discharge by pumping was 180 liters per sec. Near the Lebedi mine, the largest in the Oskolets River Basin, a cone of depression 10 km in radius and 80 m deep was formed by pumping over 1,600 liters per sec, or about 80% of the normal flow of the river. The cone extends under the river and induces recharge, increasing the need for pumping. A detailed hydrologic budget was computed for the Oskolets River and is presented in tables, graphs, and profiles, The main factors in changing the river's regime are discharge of mine drainage water into the river, diversion of water from the river for municipal and industrial use, decrease in natural groundwater discharge, and induced recharge into the mine-drainage cone of depression. (Knapp-USGS)
W69-01629

MAGNITUDE AND FREQUENCY OF FLOODS IN SUBURBAN AREAS,
R. W. Carter.
U S Geol Surv Prof Pap 424-B, B.9-B.11, 1961.

Descriptors: *Drainage systems, *Hydrographs, Land use, *Infiltration, Peak discharge, *Floods.
Identifiers: *Suburban drainage, Washington, D. C., *Surface permeability.

Suburban development changes two of the basic elements that determine the magnitude and timing of the volume and peak of the flood hydrograph, namely the average infiltration rate (which is decreased because roofs and streets are impervious), and the lag time between rainfall excess and

the flood hydrograph (which is decreased because of storm sewers and improvements to the principal stream channels). The net effect of these changes has been evaluated in the vicinity of Washington, D. C. After analysing the data statistically, it is concluded that for drainage basins larger than 4 square miles in the Washington area the maximum effect of complete suburban development on flood peaks of any recurrence interval is expressed by the ratio flood discharge (suburban): flood discharge (undeveloped)=1.8.

SEDIMENT IN SMALL RESERVOIRS DUE TO URBANIZATION,
H. P. Guy, and G. E. Ferguson.
ASCE Proc, J of Hydr Div, Vol 88, No HY2, 1962.

Descriptors: *Land use, *Sedimentation.
Identifiers: *Urban drainage.

Increasing urban development may cause severe silting in small reservoirs downstream from such developments. A typical example is that of lake Barcroft, near Washington, D. C., where 19 acre-ft or 25,000 tons of sediment have been deposited for each square mile of completed residential construction. Factors affecting sedimentation in urbanized areas are listed; these are similar to those occurring under rural conditions, but are more difficult to evaluate. Material deposited in a reservoir after urban construction will probably be coarser than that associated with rural conditions.

THE POLLUTION OF RUN-OFF FROM URBAN HOUSING ESTATES,
H. E. Kurzweil.
Gesundheits-Ing, Vol 85, 178, 1964.

Descriptors: Runoff, Rainfall-runoff relationships, *Rainfall intensity, *Water quality, *Biochemical oxygen demand, *Dissolved oxygen, *Water pollution, Sewage treatment, *Storm runoff.
Identifiers: *Urban drainage, *Storm sewers.

Based on studies of rainfall and run-off in urban areas, during storms of varying intensity, results are given on the changes in the quality of water from roofs and paved areas, including data on 5-day B.O.D., dissolved oxygen, and organic substances. The discharge of this polluted water to the storm-water sewer or sewerage system is discussed and the author recommends preliminary treatment of this run-off to reduce pollution.
W69-01831

ENVIRONMENTAL EFFECTS OF HIGHWAYS,
M. E. Scheidt.
ASCE Proc, J Sanit Eng, Div, Vol 93, No SA 5, Pap No 5509, pp 17-25, 1967.

Descriptors: *Highways, *Water pollution, Construction, *Surface runoff.

The author discusses the various polluting effects of highways on the natural environment. The greatest source of pollution is erosion during construction of the highway, which can cause considerable damage downstream, and measures to control such erosion are required during the construction of federal and federal-aided highways. Other sources of pollution are chemicals used to melt ice and snow and to control roadside vegetation, spills from vehicles involved in accidents, and run-off from paved areas.
W69-01854

ECONOMIC STUDY OF URBAN AND HIGHWAY DRAINAGE SYSTEMS,
J. W. Knapp.
Johns Hopkins Univ-Dept Sanit Eng and Water Resources-Tech Report 2, June 1965. 175 pp.

Descriptors: *Drainage systems, Design, *Highways, *Runoff, *Flood control, *Model studies, *Intakes.
Identifiers: *Urban drainage.

Characteristics of flood losses are investigated; information collected on cost of drainage facilities and damages in urban areas is analyzed; for highway drainage, interruption of traffic flow is interpreted as major flood damage; mathematical models are developed for solution of specific drainage problems; stimulation is used to describe random effects of runoff and traffic in model for selecting pumping facilities to remove storm water at highway underpass; two models for finding optimum spacing of inlets are developed and solved.

SUBURB MEETS URBANIZATION HEAD-ON,
Ayers, Lewis, Norris, and May, Ann Arbor, Mich.
R. J. Smit, R. R. Robinson, and T. W. Swift.
Water Wastes Eng, Vol 4, No 11, pp 47-9, Nov 1967.

Descriptors: *Design, *Sewers, *Construction costs, Grants.
Identifiers: *Urban drainage, Intercepter sewers.

The doubling of student enrollment since World War II at the University of Michigan has exerted considerable pressure on living facilities in the three surrounding areas, East Lansing, Lansing and Meridian Township. The existing sewage treatment plant was overloaded. The three areas negotiated to divide the costs of a new sewage treatment plant, new on-campus interceptors and new sewer main construction. Design of the main sewer system is discussed. Obstacles in planning and financing of the undertaking are described. Lateral sewers in 12 districts were financed by bonds totalling $1.84 million. In addition some financing was available through federal grants. The total construction costs were about $3.8 million. It is hoped that the lessons learned by this township government in facing the challenge of growth will be useful to other suburban communities with similar problems.

HYDROLOGIC EFFECTS OF URBAN GROWTH--SOME CHARACTERISTICS OF URBAN RUN-OFF,
A. O. Waananen.
U. S. Geol Surv Prof Pap 424-C, C.353-C.356, 1961.

Descriptors: Land use, Runoff, *Storm runoff.
Identifiers: *Urban drainage, *Urban hydrology.

The author discusses the effects of urban development on flow in streams. The changes in run-off characteristics following urban growth are illustrated graphically. Peak run-off from developed areas may be 3-4 times that from upstream or adjacent natural areas. In urban areas, a substantial part of the run-off occurs during a short period following a storm and the rapid discharge into receiving channels and streams reduces the opportunity for evaporation and transpiration as well as infiltration and percolation.

PRELIMINARY STUDY OF EFFECT OF URBANIZATION ON FLOODS IN JACKSON, MISSISSIPPI,
K. V. Wilson.
U S Geol Survey-Prof Paper 575-D, pp D259-61, 1967.

Descriptors: Land use, *Flood forecasting.
Identifiers: *Urban hydrology, *Urban drainage, Surface permeability.

Comparison of flood-frequency curves for three streams near Jackson, Miss., based on annual maximum floods for period 1953 to 1966, and for another stream for shorter period, indicates that mean annual flood for totally urbanized basin is about 4 1/2 times that of similar rural stream; it further indicates that 50-yr flood for such urbanized basin is about three times that of rural stream.
W69-01907

WATERFRONT RENEWAL IN METROPOLITAN AREAS,
Donald F. Wood.
ASCE Proc, J Urban Planning Devel Div, Vol 93, No UP4, pp 199-213, Dec 1967.

Descriptors: *Drainage systems, Flood control, Water pollution control, Planning, Recreational facilities, Storm runoff, Land use.
Identifiers: *Urban drainage.

Many of our urban waterfronts are blighted because of age and conditions unique to their location, such as vulnerability to flooding or surface water pollution. A range of actions, from simple clean-up to full scale clearance and relocation, can be used to fight waterfront deterioration. Metropolitan and basinwide approaches are needed because frequently an individual city cannot control what happens upstream or on the other side of a river. Federal urban renewal programs help to reduce the local cost. In a metropolitan waterfront renewal program the engineer must determine the condition of all shore line and the costs of repairing or replacing it. New uses can be found for old waterfront structures. Altering the amount of shore line; providing open space and access; reducing flood and storm damage; and renewing for navigational, waterfront industrial and recreational uses are also discussed. Providing adequate storm drainage for the renewal area is an important part of an improvement plan. This drainage system could be designed to improve drainage in a larger area than just the renewal project and the area benefiting can share costs. Aspects to be considered in planning include increased runoff due to development upstream, old dams, dredging of channels and winds. Some solutions are offered.
W69-01909

RUSKIN BROS, INC V STATE (DEBRIS BLOCKAGE OF CATCHBASIN).

8 App Div 2d 895, 187 N Y S 2d 51-53 (1959).

Descriptors: *New York, Judicial decisions, Riparian rights, *Screens, Natural streams, Upstream, *Watersheds (Basins), Culverts, *Obstruction to flow.

The State built a highway passing over a culvert carrying a natural stream which flowed through plaintiff's land. The State installed a screen at the

mouth of the culvert to prevent its blockage by debris coming from upstream. Plaintiff built a catchbasin on his land to lower the level of the stream to permit a covering over a part of his land. Subsequently, the State removed the screen and the debris which passed into the catchbasin caused it to become blocked and as a result plaintiff's cellar was flooded. The State is not liable for merely allowing the stream to flow unimpeded. The accumulation of water was caused by the catchbasin. An upper riparian owner is not chargeable with negligence in allowing debris to flow through his land from above which may cause damage below provided he does not increase the debris in the stream. (Molica-Fla)

4D. Watershed Protection

TIME IN URBAN HYDROLOGY,
G. E. Willeke.
ASCE Proc, J Hydraulics Div, Vol 92, No HY 1, paper 4615, pp 29-31, Jan 1966.

Descriptors: *Rainfall-runoff relationships, Rainfall intensity, Watersheds, *Hydrographs.
Identifiers: *Urban hydrology.

Analysis of lag time (defined as time between centroids of effective precipitation and runoff) from nine small urban watersheds shows that lag time variability is small and that lag time is not correlated with storm intensity; effective precipitation can be routed through storage by Muskingum method to accurately reproduce observed runoff hydrograph; effective precipitation is separated from total precipitation by phi-index; precipitation loss on watershed is closely represented by linear relationship between total storm precipitation and total storm runoff.
W69-01906

05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification OF Pollutants

LICKING RIVER AND TRIBUTARIES, OHIO (FLOOD CONTROL AND ALLIED PURPOSES).
Corps of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, House Doc No 337, 182 p, 1968. 1 map, 21 tab, 1 append, 1 attach.

Descriptors: *Multiple-purpose projects, *Flood control, *Recreation, *Channel improvements, Dams, Ohio, Cost-benefit ratio, Water values.
Identifiers: Licking River, Newark (Ohio), Economic development.

In determining the advisability of providing improvements for the assessed water resources needs within the Licking River Basin, Ohio, several reservoirs were considered for both multiple and single purpose development. Only Utica Reservoir on North Fork of Licking River was found to be economically justifiable. The Utica project would provide for the water supply and water quality control needs of the basin until the year 2020, would provide recreation opportunities to some 450,000 visitors annually, and would provide reductions of flood crests along North Fork. To further alleviate the severe and frequent flooding at Newark, several local protection schemes were investigated for three independent areas. Economically feasible projects were developed for the protection of a rapidly expanding residential area along Log Pond Run, for improving the interior drainage facilities behind the existing Federal levee, and for improvement of the North Fork channel. Acting as a system, Utica Reservoir and the improvement of the North Fork channel would prevent 91% of the average annual damages along North Fork in Newark. The diversion plan would reduce average annual damages along Log Pond Run by 73%. Improvement of the interior drainage facilities would eliminate a serious health hazard and would prevent flood damages due to insufficient pumping capacity. The survey report concludes that Utica Reservoir, the Log Pond Run diversion project, improvement of interior drainage facilities of the completed local protection project and improvement of 5,900 feet of the channel of North Fork of Licking River should be added as units in the plan of water resources development for the Licking River Basin to supplement existing projects of the Corps of Engineers.

A HORN FORETELLS SEWER OVERFLOWS.

Amer City, p 58, May, 1967.

Descriptors: *Instrumentation, *Overflow, *Sewers.

A description of an electronic device in use at five lift stations in McPherson, Kan., which warns if sewage levels rise too high is given. When sewage rises too high it contacts an electrode, a light flashes and a horn blows in police headquarters. Device saves about 100 man-hours of work/month. A sketch and wiring diagram are given.
W69-01657

TV SEWER INSPECTION,
Robert H. Brindley.
Amer City, Vol 79, pp 87-89, Jan 1964.

Descriptors: *Equipment, Sewers.
Identifiers: *Sewer inspection.

The television sewer inspection equipment of the Hartford, Conn., Metropolitan District is described in the article. Inspections have proven effective in locating house laterals, finding sewer obstructions, and determining condition of sewers. A crew consists of television operator, forward winch man, and cable guide man. The camera can best be pulled through the sewer by a hand winch that has reduction gears with a pulley and brace mounted in the manhole. A direct-wire intercom with a talk-back speaker provides communication and permits the winch man to keep both hands free. Sewers needing cleaning or flowing over one-third full are not conducive to TV inspection. Difficulties in the use of the equipment have been resolved: camera skids have been modified to prevent fouling of lines; a more powerful camera light has been installed for use in small sewers; work has been rescheduled when radio frequency interference occurred; and fog has been moved through the sewers by a portable blower forcing air into the manhole.

MONITORING STORM-WATER OVERFLOWS,
A. D. Caster.
J Water Poll Control Fed, Vol 37, pp 1275-1280, 1965.

Descriptors: *Overflow, *Water pollution control, Instrumentation.
Identifiers: *Interceptor sewers, Cincinnati (Ohio).

A description is given of the system installed at Cincinnati, Ohio, to detect when overflows occur from the sewers as a result of clogging of the interceptors with solid materials during normal dry-weather flow. A signalling device is fitted at each interceptor and the signal is transmitted to the telephone exchange. It is hoped by this means to reduce pollution of the various creeks within the metropolitan area.

NEW INSTRUMENT CAN MEASURE SEWAGE FLOW,
A. E. Cruchley.
Munic Eng, Vol 136, pp 814-815, 1959.

Descriptors: *Flow measurement, Surface drainage, *Sewers, *Flowmeters.

An illustrated description is given of a new instrument, developed by the Road Research Laboratory during investigations on surface water drainage, for recording flow in sewers. The device records variations with time in the rate of sewage flow and the periods of time during which the flow is in excess of certain values selected for particular study. The instrument is composed of a movement recorder and a time totalizer, the latter consisting of a time base and multiple-contact switch-unit within the movement-recorder and a separate box containing a rectifier and a battery of counters.

SEWAGE SAMPLING,
L. B. Escritt.
Water and Waste Treatment J, Vol 8, No 10, Nov-Dec 1961.

Descriptors: *Sampling, Instrumentation, *Sewage treatment.

Discussion on the value of sewage sampling points out the care that should be taken whether samples are collected by hand or machine and describes methods used in hand sampling, automatic sampling, and importance of weighted samples. A simple weighted automatic sampler of the type used by the London County Council at outfall works is described in detail. This sampler has no moving parts except a pump and collects 43 samples per day totaling 4 gallons at high flows and 12 samples per day, about 1 gallon of sample, during low flows in proportion to the flow.

METHODS AND EQUIPMENT FOR THE MEASUREMENT OF SEWAGE FLOW,
H. Fathmann.
Wasser Luft Betrieb, Vol 10, pp 668-673, 1966.

Descriptors: *Flow measurement, *Weirs, Instrumentation, *Sewers.
Identifiers: *Calculations.

Quantitative measurements within a definite given time are often required for experimental purposes and operational research. For this purpose tank measurements are employed, using floats and mea-

suring weirs. Stationary calculations on volume of sewage are carried out by measurements in pressure pipe lines according to the Venturi principle or as inductive measurements for the rate of flow.

A FIELD METHOD OF MEASURING AND RECORDING FLOW IN SEWERS,
C. Thorne Johnston, and Warren Ellis.
Pub Works, Vol 94, No 6, p 124, 1963.

Descriptors: *Flow measurement, *Sewers, Instrumentation, *Flowmeter.

Article describes the use of a snap-ring tube jacked into a sewer pipe in which a bubbler-tube using nitrogen gas transfers flow depth to a recorder. This method requires that a depth-discharge curve be computed for a reach of sewer. Advantage is in cost and elimination of problems of location and operation of devices such as flumes.
W69-01674

DISCHARGES FROM SEPARATE STORM SEWERS AND COMBINED SEWERS,
W. J. Benzie, and R. J. Courchaine.
Water Poll Control Fed J, Vol 38, No 3, p 410, March 1966.

Descriptors: Discharge (Water), *Coliforms, *Chemical analysis, Runoff.
Identifiers: *Combined sewers, *Storm sewers, *Bacteriological sampling.

Discharges from a separate storm sewer system showed mean median bacterial counts per 100 ml of 12 x 100,000, 0.82 x 100,000, and 1.4 x 100,000 for total coliforms, fecal coliforms, and fecal streptococci, respectively. Corresponding figures for discharge from a combined system were 94 x 100,000, 2.7 x 100,000, and 5.8 x 100,000. The ratios of fecal coliforms to fecal streptococci in the combined and separate systems were 4.7 and 0.6, respectively, indicating that the bacteria in the combined system are primarily of human origin, whereas those in the separate system are derived from other warm-blooded animals. Phosphates and nitrates in combined system discharges were about 3 to 4 times greater than contents in discharges from separate systems.
W69-01796

DESCRIPTION OF A COMMUNITY OF MICRO-ORGANISMS IN PURIFIED SEWAGE MIXED WITH RAIN WATER FROM STORM SEWERS,
T. G. N. Dresscher.
Hydrobiologia, Vol 14, 1959.

Descriptors: *Storm runoff, *Sewage effluent, Water pollution, *Chemical analysis.
Identifiers: *Bacteriological sampling, Amsterdam (Holland).

The author gives details of the community of micro-organisms isolated during the period 1953-1958 from a canal to which are discharged storm water and the effluent from the activated sludge plant serving the western part of Amsterdam. Sampling procedures and biological investigations are described and a comprehensive list of organisms isolated during this period is given. The determination of micro-biocoenosis, based on the number of micro-organisms present, is discussed. Results of bacteriological and chemical investigations are also given. The Eijkman test carried out at 45 degrees C and the determination of faecal streptococci showed a decrease in faecal pollution from 1953 to 1957, but pollution increased again in 1958. The average chemical results also showed that pollution was least in 1956 and 1957, and this coincided with a reduction in the numbers of Euglenophyceae and some other organisms.

OPERATING CHARACTERISTICS OF BACTERIAL WATER QUALITY STANDARDS,
Walter Reed Army Inst of Research, Washington, D. C.
D. W. Duttweiler.
Am Water Works Assoc J, Vol 58, No 6, pp 742-50, June 1966.

Descriptors: Design, *Water quality, *Bioindicators, *Coliforms.
Identifiers: *Bacteriological sampling, *Calculations.

Operating characteristics provide a basis for rational design of water quality surveillance programs. In this paper operating characteristic curves of the USPHS bacteriologic quality standards are derived for both the membrane filter method and the most probable number method. These curves indicate the probability that water of a certain coliform bacteria density will be acceptable. The importance of volume and number of monthly samples in determining the risks of unknowingly accepting waters having high coliform densities is discussed. Under present USPHS standards, the probability of rejecting water having a coliform density of 1 per 100 ml. is relatively constant and less than 0.01 for all membrane filter method and most probable number method day-to-day samples. It is suggested that greatly improved drinking water quality control be obtained by examining a minimum of 8 monthly 200-ml. samples by the membrane filter method for continuous surveillance. Operating characteristic curves are shown for monthly control periods for both the membrane filter method and the most probable number method.

IIGRATION OF POLLUTANTS IN A GLACIAL OUTWASH ENVIRONMENT,
Vashington State Univ., Pullman.
ames W. Crosby, III, Donald L. Johnstone, and harles H. Drake.
Vater Resources Res, Vol 4, No 5, pp 1095-1114, ct 1968. 20 p, 17 fig, 1 tab, 17 ref.

escriptors: *Path of pollutants, *Groundwater, Soil disposal fields, *Sands, *Gravels, Glacial rift, Model studies, Washington.
lentifiers: Spokane Valley (Washington).

he movement of pollutants in glacial outwash in e Spokane Valley, Washington, was studied by rilling test holes in a hospital's waste disposal stem drainfield and further checked by con-ructing a sandbox model of a stratified sand and avel deposit. Dry deposits were found, by study drilling samples and nuclear well logs, at depths 20-40 ft below the drain field. Most of the water the drain field and the model is dispersed terally in the finest beds by capillary movement nd probably returns to the atmosphere by apotranspiration. The moisture conditions in the ain field and local climate data suggest that charge by precipitation is very unlikely in the udy area. Chemical pollutants were observed to ove with moisture fronts, but particulate matter, cluding bacteria, did not travel more than a few (Knapp-USGS)

AN EVALUATION OF THE PROBLEMS OF SANITARY SEWER SYSTEM DESIGN,
J. C. Geyer, and J. J. Lentz.
J Water Poll Control Fed, Vol 38, No 7, p 1138, July 1966.

Descriptors: *Sewers, *Design, *Storm runoff, Construction, *Groundwater.
Identifiers: *Sewer infiltration, *Residential sewers.

A study of sewer systems in four communities revealed that flow of domestic wastewater follows indoor water use and undergoes little seasonal change. Per-capita use increases with the economic status of the area. Flows of stormwater and groundwater infiltration often exceed domestic flows considerably where poor sewer construction and illicit connection to the system are prevalent. Stoppages are caused chiefly by roots and accumulated deposits, the latter especially at the upper ends of systems. Bitumastic joints are most resistant to root penetration; newer materials have not been evaluated. Other causes of stoppages are slug discharges of grease and mud from construction.

ELIMINATING INFILTRATION OF GROUND WATER INTO SEWERS,
J. Godbehere.
Survr, London, Vol 121, 1962.

Descriptors: *Flow measurement, Sewers, *Sealants, *Groundwater.
Identifiers: *Sewer infiltration.

The author summarizes events which led to the application of Terraseal for controlling infiltration of ground water into sewers in the rural district of Amersham, Bucks. As a result of infiltration the cost of disposing of sewage, which is discharged to the West Herts Main Drainage Authority, became disproportionate to the population served. A method of assessing flow, used in river gauging, was used to determine volume of infiltration between sampling points. Initial measures to control infiltration were unsatisfactory, but a new chemical grouting process using Terraseal has resulted in a high degree of success. Terraseal is a form of sodium alginate capable of forming viscous solutions and of being converted to a stable jelly; addition of a suitable inhibitor to the solution during preparation prevents micro-organisms from attacking the jelly. The method of application is described.

REMOTE CONTROL GROUTING OF SEWER LINE LEAKS,
James Metz.
Water Wastes Eng, Vol 5, No 6, p 68, June 1968.

Descriptors: *Sewers, *Sealants, *Equipment.
Identifiers: *Sewer infiltration.

A procedure for repairing leaks in sewer lines, known as telegrout, involving the use of remote control grouting, is described. Equipment required in the process includes a van-type truck, chemical grout mixing and pumping equipment, sewer grouting packers and plugs, air compressor, television inspection components, winches, downhole sheaves, and communication system. A winch cable, to which is attached a television camera and sewer grouting packer, is pulled through the sewer line. The trailing winch line is attached to the grouting packer, and a communication line is placed between the two winches and the grouting engineer. The inline equipment is then moved through the sewer line. When a leak is observed on the television monitor, the grouting packer is set over the leak and sufficient chemical grout is pumped through the set packer to seal the leak. The grout requires 5 to 15 minutes to set. The television inspection system may also be used for survey work to determine the condition of lines before starting a repair program. Pictures can be made from the monitor screen for permanent records of lines being surveyed or repaired.

PING-PONG BALLS WILL TRACE POLLUTION.

Sewage Works Eng, Vol 19, p 450, Sept 1948.

Descriptors: Water pollution, *Tracers, *Sewers.
Identifiers: *Storm sewers.

Champaign-Urbana, Ill., is faced with a storm sewer problem which has apparently resulted in pollution of an area referred to as the Boneyard. The lack of funds in the budgets of the two cities had delayed a survey of the storm sewer system, but a study of sections of the sewers will be started immediately. The work will be carried out under the direction of Walter M. Kunsch, engineer-manager of the Urbana-Champaign Sanitary District. The check will be made of dropping ping-pong balls or other floating matter down toilets in the area drained by certain sections of the doubtful storm sewer system. If the balls turn up at the Boneyard, outlet for the storm sewer system, rather than at the sewage treatment plant of the Sanitary District, it will be evident that sanitary sewage is cross-connected to the storm sewers. The homes from which the ping-pong balls were discharged will be traced and the pollution corrected.

REPORT ON POLLUTION FROM OVERFLOWS - THE METROPOLITAN SANITARY DISTRICT OF GREATER CHICAGO.

Black and Veatch, Conslt Engrs, Kansas City, Mo., 1962.

Descriptors: *Overflow, Water pollution, Biochemical oxygen demand, Sewage treatment, *Storm runoff, Surface runoff.
Identifiers: *Interceptor sewers, Sewer separation.

Engineering studies of the Chicago Interceptor Sewer System - including identification of system sections which limit capacity, frequency of overflows, and pollution loads (P. E.) - showed an enormous B. O. D. contribution (75%) from the sewage treatment plants in relation to the overall pollution of the waterway. Construction of additional treatment plants nearer to the source of sewage load, tertiary treatment facilities, and ultimately, complete separation of sanitary sewage from storm water, are suggested. Areas requiring further study include the feasibility of stormwater treatment facilities, the pollutional character of surface runoff and the entire industrial waste problem.
W69-01790

PRELIMINARY POLLUTION STUDY UPPER EAST RIVER.

Report to New York City and New York State Depts of Health. Lockwood, Kessler and Bartlett, Inc., (No Date).

Descriptors: *Water pollution, Sewage effluent, Sewage treatment, *Overflow, Tracers, *Chlorination, *Storm runoff.
Identifiers: *Combined sewers, *Storage tanks, New York (N. Y.).

Basic analysis of origin of pollution in upper East River indicates that these stem from discharge of unchlorinated effluents of 4 major sewage treatment plants and overflows from 80 combined sewers. Hydrographic studies detailing float studies, dye trails and tidal observations indicate travel of pollution in area. Recommendations for further studies to determine the frequency-quantity relationship of rainy weather overflow of raw sewage and to investigate the effect of Ch and/or storage on rainy weather overflows from combined studies are made.
W69-01791

INVESTIGATION OF POLLUTION OF EASTCHESTER BAY.
Bureau of Sanitary Engineering, New York City Department of Health.

Descriptors: *Overflow, *Water pollution.
Identifiers: *Combined sewers, *Bacteriological sampling.

Data presented emphasizes that overflow from combined sewers is a major contributor to pollution in area. Bacteriological sampling data is tabulated.

ACTIVITIES REPORT, JULY 1, 1964 - JUNE 30, 1965, BASIC AND APPLIED SCIENCES BRANCH, DIVISION OF WATER SUPPLY AND POLLUTION CONTROL.
U. S. Public Health Serv.
1965, 58 pp.

Descriptors: *Water pollution control, *Surface runoff, Sewage effluent, *Chemical analysis, Bacteriological sampling, Waste dilution.
Identifiers: *Urban drainage.

This report reviews research carried out from 1964 to 1965 by the Basic and Applied Sciences Branch of the Division of Water Supply and Pollution Control, aimed at determining causes and methods of control of water pollution. Work has included studies on the chemical and microbiological analysis of wastes; the polluting effects of urban and rural run-off; the persistence of organic chemicals in surface waters and their amenability to biological degradation; the effects of pollution on aquatic life and on municipal water use; methods of waste treatment, including advanced treatment of sewage; and control of surface-water quality by dilution and by removal of nutrients from effluents. A list of papers published during the year is appended.

THE DAY-TO-DAY POLLUTION PROBLEMS OF THE THAMES ESTUARY,
L. C. Betts.
J Proc Inst Sew Purif, Pt 1, pp 48-63, 1964.

Descriptors: *Estuaries, *Storm runoff, Discharge (Water), *Water pollution control, Legislation.
Identifiers: *Thames estuary.

The author outlines some of the sources of pollution of the Thames estuary and their effects, including shipping, stormwater discharges, used cooling water, sewage-works effluent, trade effluents, and miscellaneous sources, and indicates some of the measures being taken to reduce pollution, including legislation and the work of the Port of London Authority.
W69-01797

OBSERVATIONS ON THE RECOVERY OF A BRITISH RIVER FROM GROSS ORGANIC POLLUTION,
R. O. Brinkhurst.
Hydrobiologia, Vol 25, pp 9-51, 1965.

Descriptors: Sampling, Water pollution control, Overflow, *Storm runoff, *Bioindicators.
Identifiers: Derbyshire (Great Britain).

Until 1957 the lower reaches of the river Derwent, Derbyshire, were heavily polluted with effluent from Derby sewage works and from an industrial plant and with heated cooling water from the latter and from a power plant; in 1957, a new sewage works was put in operation to treat both sewage and the industrial waste water and cooling towers and recirculation systems were installed to control the heated discharges. Since then, several biological surveys of the river above and below the sewage works have been carried out; results are tabulated and discussed. Immediately after the removal of the gross pollution there was a dramatic recovery in the condition of the river, but this was followed by a period of fluctuating conditions and there is now a uniformly poor fauna of tolerant species at all stations in spite of the chemical evidence that the river is cleaner above the sewage works than below it; it is concluded that no further improvement can be expected until upstream sources of pollution (mostly small sewage works and storm-sewage overflows) are improved and the flushing of polluted tributaries is prevented. Particular attention has been paid to the Oligochacta in the river, and the results confirm that these organisms, when identified to species and estimated quantitatively, can be useful in assessing pollution.
W69-01799

THE DETERGENT CONTENT OF RIVER WATER AS A FUNCTION OF WATER FLOW,
W. Bucksteeg, and N. Wolter.
Water Res, Vol 1, pp 325-333, 1967.

escriptors: *Storm runoff, Outlets, *Detergents, Vater pollution, *Waste dilution.

he content of detergent in river water is lowered s the water flow increases because of the dilution, ut the total amount of detergents, or the load, ses. This increase is caused by the discharge of ewage without biological treatment through ormwater outlets and by the reduction of the re-ntion-time in the river during the high flow. Both ctors diminish the possibility of biological decay, that the relationship between water flow and de-rgent load is a result of more or less complete odegradation. It is influenced by the temperature nd degradability of the detergents. The introduc-on of soft detergents since October 1964 has aused an important decrease in detergents at low nd medium water flows. The advantage of soft de-rgents is therefore masked by the growth of de-rgent use in recent years.

HEMICAL AND PHYSICAL COMPARISON F COMBINED AND SEPARATE SEWER ISCHARGES,
J. Burm, D. F. Krawczyk, and G. L. Harlow.
Water Poll Control Fed, Vol 40, No 1, p 112, Jan 968.

escriptors: Discharge (Water), *Biological ox-gen demand, Sewers.
dentifiers: *Combined sewers, *Storm sewers, Suspended solids, Ann Arbor (Mich), Detroit Mich).

comparative study of separate storm-sewer scharges in Ann Arbor, Mich., with combined scharges in Detroit showed that the BOD in the parate discharges was about 20 percent of that in e combined discharges. Concentrations lessened discharge progressed. Values for total and olatile suspended solids and for total and volatile tteable solids were higher in the separate system ecause of greater erosion in hillier terrain. hosphates were higher in combined flows, but trates were lower. Higher concentrations also ere found in the combined system for phenols, H3-N, and organic N. In the separate system, OD was fairly constant throughout the year, but the combined system summer BOD's were gher. Both systems showed lower phosphate con-ntrations in autumn.

ACTERIOLOGICAL COMPARISON ETWEEN COMBINED AND SEPARATE EWER DISCHARGES,
J. Burm, and R. D. Vaughan.
Water Poll Control Fed, Vol 38, No 3, p 400, arch 1966.

escriptors: Discharge (Water), Sewers, Coliforms, *Runoff.
dentifiers: *Combined sewers, *Storm sewers.

omparison of discharges from combined and parate sewer systems in two Michigan cities owed that total coliform concentrations in runoff rried by separate storm systems are about one nth of those in combined sewers. Fecal coliform nsities in combined systems are about 20 percent total coliform densities, but are usually a lesser rcentage in separate systems. Fecal streptococ-s densities in combined systems are only about ice those in separate systems. Ratios of fecal liforms to fecal streptocci for the systems in-cate that fecal coliforms in separate sewer scharges are primarily of non-human origin, and ose in combined sewer discharges are of human igin.

OURCE AND PERSISTENCE OF NEMATODES SURFACE WATERS,
Chaudhuri, R. Siddiqi, and R. S. Engelbrecht.
Amer Water Works Assoc, Vol 56, pp 73-88, Jan 64.

Descriptors: *Subsurface drainage, *Surface runoff, *Sewage effluent, *Bioindicators, Sampling, Water pollution.
Identifiers: *Bacteriological sampling, *Urban drainage.

The importance of collecting large volumes of water to composite nature to obtain representative samples is stressed. The 5 mu membrane filters yield a complete recovery of nematodes. Subsurface drainage, surface runoff, and waste treatment effluent are the 3 main sources of nematodes in surface waters, but only the waste effluent carries high concentrations of nematodes. Urban drainage has a higher nematode content than that of rural area. The nematode load of a stream receiving rural drainage appears to be related to the flushing capacity of the runoff and of the stream and to the carrying capacity of the stream. The persistence of nematodes in streams appears to be related to the mean stream temperature, the stream temperature changes, the rate of flow of the stream, and the nature of the nematode population. The pattern of seasonal variation in nematode populations in streams appears to be the same regardless of the source of nematodes.

FOCUS ON POLLUTION REDUCTION IN SCOTLAND,
R. W. Covill.
Survr, Vol 130, No 3938, pp 25-6, Nov 25, 1967.

Descriptors: *Water pollution control, *Surface runoff, Drainage, Estuaries.
Identifiers: *Scotland.

Industrial and population growth increased number and density of water discharge points along rivers, locks and estuaries, and similarly volume and strength of such discharges have increased; industrial effluents include organic, inorganic, radioactive, and pollution resulting from heated effluents; land drainage comprises silt pollution, surplus irrigation water, surface water runoff and agricultural particles and fertilizers; responsibility for water resources management should be vested in one organization covering functions of potable and industrial water supply, drainage, and municipal and industrial water treatment and pollution prevention.

FIELD STUDIES ON THE FLOW AND COMPOSITION OF STORM SEWAGE,
R. N. Davidson, and A. L. H. Gameson.
Symposium on Storm Sewage Overflows, May 4, 1967. Sponsored by the Institution of Civil Engineers (Gt Brit).

Descriptors: *Overflow, *Storm runoff, *Sampling, *Biochemical oxygen demand, *Water pollution.
Identifiers: *Suspended solids.

Investigations on sewers draining three areas, one in Northampton, one in Bradford, and one in Brighouse resulted in data from which several graphs and equations were derived and used to estimate the effect of changes in overflow setting on the frequency duration and volume of discharge from a hypothetical overflow. The overflows at Brighouse and Bradford did not conform to such ideal conditions. Calculations indicated that the flow at which first spill should occur might vary by over 3%. These particular overflows are discussed and the various ways of expressing overflow settings are summarized. An automatic sampler was used at each site for storm sewage. There was a tendency for the strength of sewage to decrease with time during a storm. Variations in average composition of storm sewage with ratio of excess flow to total flow are given. Tables are included of the average maximum values of suspended solids and BOD, the multiples of daily dry weather load discharges from hypothetical overflow at Northampton, and existing overflows at Bradford and Brighouse in a year of average rainfall.
W69-01807

BACTERIAL SURVEY OF STREAMS AND BATHING BEACHES AT CLEVELAND,
J. S. Delos.
Sewage and Industrial Wastes, Vol 22, No 12, pp 1618-24, Dec 1950.

Descriptors: *Water pollution, *Recreation facilities, *Storm runoff, *Overflow, *Coliforms, Bioindicators.
Identifiers: Bacteriological sampling, Cleveland (Ohio).

This article is a condensation of the original report submitted to the Commissioner of Sewage Disposal and covers the 1949 survey and a comparison with earlier pre-war studies. The objects of the 1949 survey were: (1) To determine the present level of pollution of the bathing beaches as compared to prewar level. (2) To determine the effect of storm water overflows on the pollution level. (3) To determine the quality of water flowing in the streams discharging into the lake. Brief description of testing, areas tested and short tables of data are included. Conclusions reached were that coliform count definitely increased during wet period. For a given period, the number of days of rain has a greater effect than the amount of rain which fell at a particular period.

POLLUTION PREVENTION IN NORTHERN IRELAND,
T. R. Graham.
Effluent Water Treatment J, Vol 7, No 1, pp 35-37, Jan 1967.

Descriptors: *Water pollution, *Storm runoff, *Overflow, Rainfall intensity.
Identifiers: *Combined sewers, *Storage tanks, Northern Ireland.

A general report on current water quality conditions in Northern Ireland at a time of intense expansion involving the growth of cities, creation of a city, construction of a motorway network, and the doubling of ferry capacity between Britain and Northern Ireland is presented. The need for future legislation that will prevent and control pollution from industrial and agricultural effluents is stressed. Where there are combined sewers, high rainfall in some areas causes much direct pollution from storm sewage and prevents adequate retention time of storm water at the works. New development areas have separate sewage systems. In a few areas storm-water is settled by tanks at the overflow, with occasional desludging.

SOURCES AND CONTROL OF RIVER POLLUTION,
R. D. Hoak.
Instruments, Vol 25, No 12, pp 1714-6, Dec 1952.

Descriptors: *Storm runoff, *Water pollution, Water pollution control, *Instrumentation.
Identifiers: *Urban drainage.

Five principal sources are erosion, storm water runoff from urban areas, domestic sewage, industrial waste and acid mine waters; varieties of pollution which result from these causes; extent of stream self purification; pollution control and types of instruments applicable.
W69-01822

PATHS OF POLLUTION IN NEW YORK HARBOR-MODEL STUDY,
W. T. Ingram, and H. Mitwally.
Water Poll Control Fed J, Vol 38, No 10, pp 1563-81, Oct 1966.

Descriptors: *Path of pollutants, *Model studies, *Water pollution, *Storm runoff, Overflow, Estuaries.
Identifiers: New York (N Y).

Extensive study utilized dye releases in model of New York Harbor to trace paths followed by pollutants discharged at particular points; influences of installed jetties and dikes on pollution paths and relationship between release concentrations at source of pollution developed by individual tests and those shown by simultaneous release from multiple sources were investigated; pollution sources were wastewater treatment plants and stormwater overflows; this type of study is useful in predicting effects on pollution paths of changes in harbor configuration and waste discharge before such changes actually are made in prototype.

SEWAGE LOAD OF RECEIVING STREAMS FROM MIXED SEWERS,
H. H. Mueller.
Gas-Wasserfach, Vol 109, No 6, pp 143-147, 1968.

Descriptors: *Water pollution, Sewage treatment, *Storm runoff, *Overflow.
Identifiers: *Calculations, *Storage tanks, *Capacity, *Combined sewers.

Investigations into the determination of the amount of impurities which are annually introduced, under specific combinations of control measures, into receiving streams are described. Fundamental theories and assumptions are presented, followed by the corresponding calculations. The balance of impurities shows that the introduction of rainwater settling tanks into the treatment considerably increases the efficiency which also depends on the chosen critical rainfall and the size of the tanks. The (1+4)Q sub s infeed to the sewage plant results in favorable efficiency only for small critical rainfalls and small tanks. Larger tanks are best used when the (1+1)Q sub s infeed to the plant is observed. In size determinations, consideration should preferably be given to a critical rainfall of 10 to 15 l/s.ha. Rainwater hold-up time in the settling tanks should be at least 10 minutes. However, if it is possible to install a large collecting main with a high threshold for the rainwater overflow, an equivalent effect would be obtained with a hold-up time of about 3 minutes for the maximum infeed.

MERRIMACK RIVER POLLUTION ABATEMENT STUDY,
P. W. Prendiville.
Boston Soc Civ Engrs, Vol 51, pp 316-328, 1964.

Descriptors: *Storm runoff, *Overflow, *Water pollution control, Sewage treatment, Sewage lagoons, Estuaries.
Identifiers: Merrimac River (Mass).

In view of the increasing pollution of the Merrimack River, which is formed in New Hampshire by the confluence of the Pemigewasset and Winnipesaukee Rivers and flows through Massachusetts to the Atlantic Ocean, surveys have been carried out to determine the present condition of the river and the degree of treatment required for sewage and trade waste waters discharged to it. The results of the investigations on the extent of organic and bacterial pollution and the polluting effects of overflows of mixed sewage and storm water are discussed briefly. Various alternative plans for sewage treatment have been considered, and it was recommended that the individual communities and metropolitan regions should be responsible for constructing the necessary sewage-treatment facilities; these would include extended-aeration plants, primary treatment plants, and sewage lagoons. An industrial survey showed that all the trade waste waters in the area can be treated in the municipal plants, after preliminary treatment at the source in some cases.

POLLUTION STUDY OF A FUTURE TIDAL ESTUARY,
C. A. Rambow.
J Water Poll Control Fed, Vol 36, pp 520-528, 1964.

Descriptors: *Estuaries, Surface runoff, *Flood control, *Dissolved oxygen, *Path of pollutants, Outlets, *Biochemical oxygen demand.
Identifiers: *Los Angeles (Calif).

Dominguez channel is a natural watercourse carrying surface run-off and waste discharges from an area south-west of Los Angeles into the east basin of Los Angeles Harbour. During heavy rainstorms, flooding occurs, and the lower portion of the channel is now being improved to control this. The design is such that the invert will be below mean sea level for a distance upstream of more than 8 miles, and the finished channel will therefore constitute a tidal estuary. At present, the waste waters discharged to the channel are too strong for biochemical action to occur, but when diluted with a large volume of sea water it is possible that biochemical degradation will occur in the channel, with depletion of dissolved oxygen and formation of odours. Theoretical analysis was, therefore, used to estimate the waste-assimilating capacity of the improved channel; this involved calculation of the spread of pollutants from the various outfalls, estimation of the oxygen resources of the channel, and comparison of oxygen demand with oxygen resources to determine the most critical point of the channel. By equating B.O.D. to oxygen supply at this point, an oxygen sag curve for the channel was obtained for the calculated B.O.D. loadings; this curve can be used as the basis for siting future outfalls and for determining the allowable discharge of B.O.D. by various industries.

PUBLIC HEALTH - WATER SUPPLY.

Mass Ann Laws ch 111, secs 159-175 (1967).

Descriptors: *Massachusetts, Legislation, Administration, *Administrative agencies, Water policy, Water pollution control, Water pollution sources, *Water quality, Water requirements, Permits, Pollution abatement, *Regulation.

The department of public health is given general supervision over all inland water sources used by cities, towns, public institutions, etc. A permit from the department is required before anyone may make a cross connection between a water distribution system for domestic water and one for water not approved by the department. The department may, upon petition and after public hearing order the abatement of pollution. Appeals are provided for, and either the supreme judicial or the superior court is to enforce the orders of the department. Agents of the department may enter any premises to find whether sources of pollution exist there, or to see if the department's orders are being followed. Several rivers are exempted from these provisions. No polluting matter may be discharged into any body of water which is a water source for domestic uses, but prescriptive and legislatively granted rights are not to be affected by this provision. Pollution may be enjoined by either the supreme judicial or the superior court. A penalty is set for willful defilement of a water source or conductor, and for bathing in a source of water for domestic use. Arrests without warrant are authorized for such violations. Driving animals across ice to be cut for domestic purposes is forbidden. Special provisions are made to protect the Charles River from pollution. (Williams-Fla)

WEST KY COAL CO V RUDD (ACTION BY FARM OWNER AGAINST 8 COAL MINING CO'S TO ENJOIN DISCHARGE OF COAL WASTES).
328 S W 2d 156-161 (Ct App Ky 1959).

Descriptors: *Kentucky, Judicial decisions, Farms, *Coal mine wastes, *Rivers, *Overflow, Damages, Water pollution, Sewage, Prescriptive rights, Drainage, Mining, Minewater, Acid mine water, Mine acids.
Identifiers: Injunction, Equity.

An action was brought by a farm owner against coal mining companies to enjoin the discharge of coal slack, copperas waters, and other deleterious substances into the waters of a river from which they were deposited on his farm during overflow periods, causing damage to productivity and fertility. The farm owner also sought damages. The trial court granted the injunction and ordered the damages issue transferred to a common law docket for a jury trial. The appelate court held that when a court of equity had taken jurisdiction, the plaintiff was properly not required to elect which company he would seek damages against, although the companies were not joint tortfeasors. The statute requiring water to be drained as directly as practicable to adjacent streams or watercourses from mines was designed only to require that the water be kept out of working places for safety purposes. It could not be construed as direction or permission to pollute waters, but if the statute could be so construed, it would have been impliedly repealed by the pollution statutes. (Watson-Fla)

NORTH DADE WATER CO V ADKEN LAND CO (INJUNCTIVE RELIEF FROM DRAINING OF EFFLUENTS INTO PRIVATE LAKES).

114 So 2d 347-348 (3d D C A Fla 1959).

Descriptors: *Florida, Judicial decisions, *Effluents, *Drainage effects, Public health, Sewage bacteria, *Water pollution, Sewage effluent, Water pollution sources.

A temporary injunction was granted by the trial court, enjoining the North Dade Water Company from draining effluent into two land locked lakes located on appellee's property. Appellant discharged effluent into Myrtle Lake, which is joined with appellee's lakes by a culvert which was recently installed. Appellee presented evidence showing sewage in both of his lakes and attesting to a strong odor in the area of Myrtle Lake. The appellate court upheld the decision, stating that the judge must have considered possible future pollution and its effect on the health and welfare of the surrounding property owners. 5C. Effects of Pollution

COMPARISON OF THE DISTRIBUTION OF ORGANIC MATTER IN THE FIVE GREAT LAKES,
Michigan Univ., Ann Arbor, Great Lakes Research Div., Inst. of Science and Tech.
Andrew Robertson, and Charles F. Powers.
Part of final rept. of USPHS Grant WP-00311 Michigan Univ Spec No 30 of the Great Lakes Res Div pp 1-18, 1967. 18 p, 7 tab, 3 fig, 22 ref. ONR 104-818.

Descriptors: *Eutrophication, *Great Lakes, Nutrients, Plankton, Zooplankton, Productivity, Surface waters, Water quality, Dissolved solids, Organic matter, Biological properties.
Identifiers: *Particulate organic matter, Macrobenthos.

Particulate and dissolved organic matter were measured in all 5 of the Great Lakes and the biomass of zooplankton and macrobenthos were measured in the upper 3 lakes. In general, total organic matter increases in the order, Superior, Huron, Michigan, Erie, Ontario, the same order as shown by total dissolved solids and total dissolved organic matter. This may also represent their relative states of eutrophication. Dissolved organic matter content in the surface waters is 2.22-2.98 mg/l in Lake Superior, 2.52-2.91 mg/l in Lake Huron, 3.24-5.81 mg/l in Lake Michigan, 5.82-6.01 mg/l in Lake Erie, and 5.85-6.53 mg/l in Lake Ontario. The particulate organic matter is much greater than the amounts of zooplankton and macrobenthos. (K-napp-USGS)

PESTICIDE OCCURRENCE, CONCENTRATION AND DEGRADATION IN FREE WATER SYSTEMS,
Massachusetts Univ., Amherst.
C. W. Miller, B. M. Zuckerman, and H. B. Gunner.

Mass Univ, Water Resources Res Center, Symp Proc, Publication No 3, pp 94-99, June 2, 1967. 6), 5 tab, 5 ref.

Descriptors: *Pesticide kinetics, *Pesticide esidues, *Degradation (Decomposition), *Translocation, Cranberries, Diazinon, Dieldrin, Fish, Mussels, Fresh Water, Irrigation.
Identifiers: *Pesticide concentration, Parathion, Cranberry bogs.

The degradation and movement of pesticides used n cranberry bogs were studied to relate application ractices to pesticide pollution. Dieldrin is usually pplied in granular form once every 4-5 yr. Soil amples 12 in. deep were collected from areas with ast histories of dieldrim applications. Analyses inicated that very little vertical leaching occurs even fter 10 yr, probably because of high organic conent of the soil. None has been observed in solution n drainage water. The effect of flooding on movement of diazinon and parathion was studied by ooding a greenhouse model of a cranberry bog on hich the chemical had been applied at field rates. bout 4.6% of the diazinon and 6.5% of the arathion were present in the flood waters. arathion concentration decreased from 0.07 ppm o 0.002 ppm and diazinon decreased from 0.32 pm to 0.01 ppm, in 144 hours. It is recommended at no bogs be flooded for at least 72 hr following esticide application, and that when water flows rough a bog, less hazardous chemicals be used. (Knapp-USGS)

DSORPTION OF PESTICIDES ON EARTH ATERIALS,
assachusetts Univ., Amherst, Dep of Plant and oil Sciences.
H. Baker, and Oh Young Shin.
ass Univ, Water Resources Res Center, Symp oc, Publication No 3, pp 75-88, June 2, 1967. 14 5 fig, 7 tab, 7 ref.

escriptors: *Pesticide kinetics, *Adsorption, arth materials, Soils, Clays, Soil water, Diazinon, rbicides, Organic matter, Leaching.
entifiers: Atrazine, Stream sediments.

eliminary experiments were performed to deterne the effects of time, salt concentration, and ncentration of atrazine and diazinon on the adrption of atrazine and diazinon, which are comnly used pesticides, on soils. Equilibrium was atned within 6 hr. Atrazine adsorption was connt over the range of salt concentration to be excted in soil water, but increased greatly at a conntration of 0.5 moles per liter. The amount of azine absorbed is a linear function of atrazine ncentration. The only soil property that seemed be related to atrazine adsorption was organic ntent. The adsorption of atrazine on pure clay nerals was studied and the results are presented tables. Diazinon was more strongly adsorbed than atrazine, and its adsorption is more affected by organic content. Tabulated data include the effect of time of reaction on atrazine adsorption, the effect of calcium chloride on atrazine adsorption, distribution coefficients for atrazine adsorption on 21 soils, linear regression coefficients relating atrazine adsorption to organic content, distribution coefficients for diazinon adsorption on 16 soils, and hydrolysis of diazinon in the presence of montmorillonite. (Knapp-USGS)

STUDIES OF MILWAUKEE HARBOR AND EMBAYMENT,
Michigan Univ., Ann Arbor, Great Lakes Res Div, Inst of Science and Tech.
John C. Ayers, and Joseph C. K. Huang.
Michigan Univ Spec Rep No 30 of the Great Lakes Res Div, pp 372-394, 1967. 22 p, 9 fig, 2 ref.

Descriptors: *Water pollution effects, *Lake Michigan, *Eutrophication, Pollutants, Turbidity, Color, Dissolved oxygen, Oligochaetes, Bioindicators, Amphipoda, Bottom sediments, Benthos.
Identifiers: *Water-borne parameters, Milwaukee Harbor.

The quality of water and the biological associations of Milwaukee Harbor water and adjoining Lake Michigan water were studied to learn the mutual effects of the heavily polluted harbor on the lake and of the clean lake on the harbor. Milwaukee harbor is enclosed by a breakwater and heavily polluted by the Milwaukee River and by a sewage outfall just south of the river inside the breakwater. Municipal water intakes are located to the north and south of the harbor entrance and obtain good quality water. The distribution of oligochaetes, sphaeriids, and amphipods, as well as of transparency sulfides, and dissolved solids indicate that Milqaukee harbor is functioning as a sewage lagoon in which settlement and mineralization take place. Currents move generally northward in the area from September through March and southward from April through August. Polluted water from the harbor seldom reaches the intakes to the city water system, and on the few occasions it does it is much diluted by lake water and somewhat purified by its residence in the harbor. (Knapp-USGS)
W69-01649

THE INTERNAL DISTRIBUTION OF ANALYSIS VALUES AS AN INDICATOR OF EUTROPHICATION,
Michigan Univ., Ann Arbor, Great Lakes Res Div, Inst of Science and Tech.
John C. Ayers.
Michigan Univ Spec Rep No 30 of the Great Lakes Res Div, pp 395-411, 1967. 17 p, 7 fig, 4 tab, 7 ref.

Descriptors: *Eutrophication, *Indicators, *Lake Michigan, *Statistical methods, Frequency analysis, Dissolved solids, Nitrogen, Phosphorus, Seston, Sulfates, Conductivity.
Identifiers: Skewness, Kurtosis.

The skewness and kurtosis of frequency curves of chemical analysis data of Lake Michigan water and sediments were used to show subtle changes in the early stages of eutrophication. The data analyzed are concentrations of orthophosphate, sulfate, seston ash, total dissolved solids, total phosphorus, nitrogen by Kjeldahl analysis, and conductivity. Definite differences in skewness and kurtosis were found in the distribution of the analyzed concentrations between sampling lines across the industrialized and eutrophying southern end of the lake and sampling lines farther north. The northern data were more skewed and peaked in phosphorus, sulfate, conductivity, and seston ash. The southern lines were more skewed and peaked in nitrogen ashfree dissolved solids, and total dissolved solids. (Knapp-USGS)

PERMISSIBLE WATER POLLUTION AT COMBINED SEWER OVERFLOWS,
G. Akerlindh.
Sewage Works J, Vol 21, No 6, p 1059, 1949.

Descriptors: *Overflow, *Water pollution, Dissolved oxygen, Coliforms.
Identifiers: *Combined sewers.

By plotting the hours duration of storm-water overflow against allowable D.O. content and coliform density in the stream, on double log diagrams, the author presents a method for estimating the permissible storm water overflow in a receiving body of water.
W69-01681

THE BACTERIOLOGICAL EFFECT OF COMBINED SEWER OVERFLOWS ON THE DETROIT RIVER,
R. J. Burm.
J Water Poll Control Fed, Vol 39, No 3, p 410, March 1967.

Descriptors: *Overflow, Discharge (Water), *Coliforms, *Water quality, *Rainfall intensity.
Identifiers: *Combined sewers, Detroit (Mich).

A study of water quality at various points in the Detroit River before and after rainfalls causing overflows of combined sewers showed that, in at least this case, effects of these overflows persist for several days after discharge has ceased, with duration of effects increasing with increase in the intensity of the storm. Bacterial densities may increase a thousandfold after moderate rains at sampling points, within several miles downstream from combined sewer outfalls. Farther downstream, increases in bacterial densities are less, but occur over greater portions of the stream width. Fecal coliforms and fecal streptococci follow patterns similar to those of total coliforms.
W69-01730

POLLUTIONAL EFFECTS OF STORMWATER AND OVERFLOWS FROM COMBINED SEWER SYSTEMS.

Public Health Service Pub No 1246, 1964.

Descriptors: *Storm runoff, *Overflow, *Water pollution control, Sewage treatment, Sewers, Water pollution, *Control, Cities.
Identifiers: *Combined sewers.

The purpose of this report is to examine and assess in a preliminary way existing data on stormwater and combined sewer overflows in regards to characteristics and pollutional effects, and to investigate existing and possible corrective measures for dealing with the problem. The sources of data include more than 50 engineering reports and completed questionnaires regarding sewer systems and/or sewage treatment, reports of detailed studies of water quality data and stormwater separations, and interviews with municipal sanitation representatives. These sources provide information on (a) quantity and quality of combined sewer overflows; (b) effects on streams, water uses, and users; (c) adverse effects, and if any, existing or suggested control measures and their effectiveness; and (d) costs necessary for control.

SELF-PURIFICATION IN MUSSELS FROM THE MEDITERRANEAN-ITS USEFULNESS - ITS ACCOMPLISHMENT-RESULTS OBTAINED,
R. Buttiaux, and R. Ferrand.
Symp Comm Int Explor Scient Mer Medit, Monaco, 1964, pp 299-306, 1965.

Descriptors: *Water pollution, *Storm runoff, Outlets, *Overflow, *Pathogenic bacteria, Standards, *Shellfish.
Identifiers: *Bacteriological sampling, Toulon (France), Interceptor sewers.

Mussels cultivated in Lazaret bay, Toulon, France, are subjected to much pollution and have in the past caused serious typhoid epidemics. The bay, which is almost completely enclosed, being connected with the open sea by only two narrow passages, receives waste waters from the dockyard and from warships anchored in the harbour; polluting material is also carried into the bay by run-off, during the heavy storms which are frequent in this region; and although an intercepting sewer, with an outfall outside the bay, has been built to divert a large part of the municipal sewage, the storm-sewage overflows still discharge into the bay itself, and the water and mussels still suffer faecal contamination, as shown by tabulated data. Although bacteriological examination of water in the bay before and after a period of 5 hours' sunshine showed an important reduction in the numbers of Escherichieae, the bactericida action of sea water is slow, especially in the case of Salmonella, and it is too slow to prevent the penetration of salmonellae into molluscs. A plant was therefore set up at Toulon for the self-purification of shellfish in clean sea water and the bacteriological quality of mussels was assessed before and after treatment, on the basis of standards proposed for the content of Escherichia coli and Streptococcus D. Good results were achieved as regards the protection of public health, with no loss in the organoleptic quality of the shellfish.

STORM-WATER INVESTIGATIONS AT NORTHAMPTON,
A. L. H. Gameson, and R. N. Davidson.
J Inst Sew Purif, Pt 2, 1963.

Descriptors: *Flow measurement, *Biochemical oxygen demand, *Storm runoff, Water pollution, *Overflow, Sewage effluent, Sewage treatment.
Identifiers: *Suspended solids, *Storage tanks, *Capacity.

Tabulated and graphical results are given of studies carried out at Northampton over a period of 2 years on the flow and composition of sewage in a main sewer, with no overflows, particularly during wet weather. It was found that the strength of the storm sewage entering the system, as judged by the B.O.D., was less at high flows, decreased with time since the start of the storm, and increased with length of time since the previous storm. The storm sewage contained a higher concentration of suspended solids than did crude sewage, the greatest concentration of solids being associated with the first flush of storm sewage and this maximum value was greatest when the storm had been preceded by several days of dry weather. The polluting effect of the first flush of storm sewage is attributed to the scouring out of grit and organic solids deposited in the system during dry weather. It was estimated that, had the system been provided with a storm-water overflow, raising the setting of the overflow by one times dry-weather flow would have roughly the same proportional effect throughout the range from 3 to 30 times dry-weather flow, and no substantial reduction in the amount of polluting matter discharged would be achieved by a small change in the setting. However, the provision of storage capacity equivalent to 2-hour dry-weather flow at the overflow would reduce the B.O.D. load discharged from an overflow set at 6 times dry-weather flow by about 40 per cent, and trebling the storage capacity would reduce the load by a further 20 per cent of the initial value, equivalent to raising the overflow setting to 11 times dry-weather flow. The average B.O.D. load discharged per year from an overflow set at 6 times dry-weather flow would be nearly as great as the B.O.D. load discharged as sewage-works effluent during the same period if the whole flow to treatment were discharged as effluent with B.O.D. of 20 ppm and the suspended solids discharged would be equivalent to 3 times the load in a sewage effluent containing 30 ppm solids. It is stressed that the results of this investigation cannot be applied to other sewerage systems until comparable data are available for other sites.
W69-01816

THE RETENTION OF POLLUTING MATTER FROM STORM OVERFLOWS,
H. Guntzel.
Gesundheits-Ing, Vol 56, 1933.

Descriptors: *Storm runoff, *Water pollution, *Overflow, Weirs, Design.
Identifiers: *Suspended solids.

Discusses the effect on streams of polluting matter carried by storm water from sewer overflows, conditions of flow at overflow weirs, different methods of retaining solid matter (screens, settling tanks, baffles, etc.) and their advantages, disadvantages and possible improvement. A design of overflow is suggested in which the overflow water passes through screens inclined at such an angle that the screening can be returned by an automatic scraper. The installation of a screening plant permits the discharge of greater quantities of storm water into a stream as the dilution necessary is less for screened than for unscreened storm water. The economics of storm water treatment are discussed.
W69-01819

EFFECT OF STORM OVERFLOWS ON RIVER QUALITY,
W. F. Lester.
Symp on Storm Sewage Overflows, May 4, 1967. Sponsored by the Institution of Civil Engineers.

Descriptors: *Water quality, *Overflow, *Storm runoff, Discharge (Water), *Water pollution.
Identifiers: *Storage tanks.

It is assumed that the 'standard' storm sewage overflow in excess of 6 d.w.f. flows to a river which has a rate of flow of 1, 10, and 100 times d.w.f. of the sewage. It is shown that the quality change with increase in rate of flow will depend on the initial quality of the stream. A table indicates the quality of river water below storm overflows. Because the discharges contain more carbohydrates and higher organic compounds than fully treated effluent there is a greater tendency to form fungal growths below overflows. The discharge of E. coli. content increases. The concentrations of toxic materials may be critical from sewers containing industrial wastes. Where rivers are used for direct abstraction of water for potable supplies, overflows cause rapid changes in quality. Fractured sewers can also cause pollution of rivers. The discharges from 'standard' storm tanks will have as much as 80% reduction in pollutional effects on rivers. Brief reports are made on surveys of the River Trent and Tame to determine the effect of storm discharges on these two rivers.

PROBLEMS IN THE CALCULATION OF STORM WATER OVERFLOWS,
W. Losse.
Gas Wasserfach, Vol 29, pp 84-5, 1958.

Descriptors: *Storm runoff, *Overflow, Water pollution, *Rainfall intensity, Design.

The author discusses, from personal experience and from the literature, the amounts of rainfall for which storm water overflows should be designed in order to avoid pollution of the receiving stream. Amounts between 6-10 liters/sec./ha are suggested, varying according to the stream, the slope of the land, and the condition of the sewerage system. The figures must be tested by careful investigation. Calculation of storm water overflows according to amounts of rainfall is preferable to calculation by a mixing ratio which may give a false impression of the load of the stream.
W69-01834

THE STORM-SEWAGE POLLUTION PROBLEM,
C. Lumb.
J Proc Inst Sew Purif, 1964, Pt 2, p 168, 1964.

Descriptors: *Storm runoff, *Overflow, *Water pollution, Design, Sewers, Sewage treatment.
Identifiers: *Combined sewers, *Sewer separation, *Storage tanks.

The author discusses the polluting effects of storm-sewage overflows from combined sewerage systems and methods for reducing such pollution, including the installation of separate sewerage systems, the use of overflow settings higher than the conventional 6 times dry-weather flow, improved design of overflows, screening of storm sewage, and provision of storage facilities at overflows to receive the first flush of the discharge and return it later to the foul sewer. Pollution may also be caused by discharges of partially treated storm sewage from storm-sewage tanks at sewage works; this can be reduced by increasing the flows to be given full treatment and by improved design and operation of storm-sewage tanks.

STORM WATER POLLUTION CONTROL,
Gordon E. McCallum, and Leo Weaver.
Interstate Conf on Water Problems, Dayton, Ohio Dec 10, 1965 9 p, 12 ref.

Descriptors: *Storm runoff, *Water pollution Sewage treatment.
Identifiers: *Combined sewers, *Storm sewers *Sewer separation, Storage tanks.

Inadequacies of combined sewage systems are discussed. Pollution by storm water runoff is described. Government grant projects aimed a solving this problem are outlined. The costlines and relative insufficiency of complete separation o storm sewers from sanitary sewers is mentioned and the need for new alternative solutions (e.g holding tanks, treatment) emphasized.
W69-01836

THE POLLUTIONAL EFFECTS OF STORM WATER OVERFLOWS FROM COMBINED SEWERS,
C. L. Palmer.
Sewage and Industrial Wastes, Vol 22, pp 154-65 1950.

Descriptors: *Water pollution, *Storm runoff *Overflow, Rainfall intensity, Water pollution control.
Identifiers: *Combined sewers, Capacity, *Interceptor sewers.

The author discusses the effects of pollution caused by overflowing of storm water from a combine sewer system. The characteristics of low intensit storms in the Detroit area were first studied and th results shown in graphs. It was found that runoff di not occur unless precipitation was greater tha 0.03 in/hr and storm water would not overflow un less precipitation was more than 0.03 in/hr. plus th capacity of the sewers for storm water. It was foun that intercepting sewers are most effective i preventing overflow when they have a capacity o 150% of the sewage flow, and no satisfactor reduction in number of duration of overflows achieved by increasing the capacity to any reasona ble extent. The quality of the overflowing liquid va ries considerably and would be highly pollutin even from a separate system, the cost of which not commensurate with the reduction in pollutio which it would effect. A properly designed com bined sewerage system should be about 99% effe tive in preventing pollution by storm water ove flows.
W69-01843

SEWERAGE SYSTEMS AND RIVER POLLUTION,
J. A. Pickford.
J Royal Soc Health, Vol 87, No 1, pp 36-42, Ja Feb, 1967.

Descriptors: *Water pollution, *Discharg (Water), *Rainfall intensity, *Storm runoff, *Ove flow, Sewers, Water pollution control.
Identifiers: *Combined sewers, *Storm sewer *Sewer separation, *Capacity.

The effect of discharge of combined, separate, or partially separate sewer systems on river pollution is discussed. Factors affecting the quantity of storm sewage are rainfall and run-off, overflow devices, and the storage capacity of sewers. Several overflow devices are discussed. It is suggested that the increase of treatment plant capacity, the provision of larger sewers, and the provision of selective types of overflow are likely to cost much less than the provision of completely separate systems, and that pollution can be more effectively controlled by these methods.

EUTROPHICATION OF ESTUARINE AREAS BY RAIN WATER,
R. J. Reimold, and F. C. Daiber.
Chesapeake Sci, Vol 8, pp 132-133, 1967.

Descriptors: *Chemical analysis, Rain, Storm runoff, *Estuaries, *Eutrophication, Water quality.
Identifiers: *Atlantic Coast (United States).

Tabulated and graphical results are given of analyses of total phosphorus in rain water at Lewes, Del., from February 1966 to January 1967; the mean concentrations, per litre, were 4.9 microgram-atom in winter and spring, 150 microgram-atom in summer, and 8.1 microgram-atom in autumn and winter. Possible causes of the sudden increase after April are discussed, and it is suggested that this is the reason for the unusual phosphorus cycles found in bay waters and marshes along the east coast of U.S.A., providing an extra source of nutrient during spring and summer when productivity tends to be higher.

HOW COMBINED SEWERS AFFECT WATER POLLUTION. PT 1,
Harold Romer, and Lester Klashman.
Pub Works, Vol 94, p 100, March 1963.

Descriptors: *Water pollution, Sewage treatment, *Design, Discharge (Water).
Identifiers: *Combined sewers, *Urban drainage, Capacity.

This article on studies of pollution of combined sewers discusses results of a questionnaire survey of 148 cities, 80 of which replied (50,000-2,100,000 population). The 11 questions deal with characteristics of combined sewage, combined sewer and treatment plant capacities and design, combined sewage treatment practices, and effects of combined sewage discharges on quality of receiving waters.

THE INFLUENCE OF COMBINED SEWERS ON POLLUTION CONTROL,
H. Romer, and L. M. Klashman.
Pub Works, Vol 92, No 10, p 129, 1961.

Descriptors: *Water pollution, *Overflow, Design, Surface runoff, *Storm runoff.
Identifiers: *Combined sewers, *Suspended solids, *United States, *Great Britain, *Storage tanks.

In discussing the polluting effects of overflows from combined sewers, the authors review American and British practice concerning the use of storm-water tanks and summarize British recommendations for the design and operation of combined sewerage systems. Data are given to illustrate the effect of storms on the concentration of supsended solids in storm-water sewage, and the results of studies on quality of surface run-off are reviewed. The use of storm-water tanks in America is being reconsidered.

YEATES V MILLSAPS (OIL POLLUTION).

110 So 2d 369-372 (Miss 1959).

Descriptors: Remedies, Metal pipes, Pipelines, *Damages, Burning, *Mississippi, Cattle, Judicial decisions, *Oily water, Legal aspects, *Water pollution, Pollutants, Oil.
Identifiers: Res ipsa loquitur, Punitive damages.

Plaintiff sued for damages to his land and cattle resulting from a break in defendant's oil pipeline. Defendant had constructed a pipeline near plaintiff's land in 1954. In 1957 a break occurred in the pipeline, allowing oil to spill into a stream which meandered across plaintiff's land. In an effort to remedy the situation, defendant attempted to burn off the oil, thereby damaging the land. In addition, several of plaintiff's cows were killed or injured as a result of drinking oily water. The lower court applied the doctrine of res ipsa loquitur and submitted the issue of punitive damages to the jury with regard to defendant's efforts to burn the oil. Plaintiff recovered $7500. This court held that the res ipsa loquitur doctrine was applicable, and whether defendant had overcome the presumption of negligence was a jury question. The judgment was reversed and remanded, however, since the issue of punitive damages was unwarranted and the court was unable to say that the verdict rendered represented only actual damages. (Kahle-Fla)

AMERICAN CYANAMID CO. V SPARTO (INDUSTRIAL POLLUTION).

267 F 2d 425 (5th Cir 1959).

Descriptors: *Texas, Judicial decisions, Easements, Water rights, Competing uses, *Irrigation water, Riparian waters, Water pollution, Agricultural watersheds, *Industrial wastes, Reasonable use, Chemical wastes, Inorganic compounds, Sodium sulfate, Ammonium compounds, *Riparian rights.

Plaintiffs' land is bounded by a river which is used to irrigate their truck farm. Defendant's upstream chemical plant empties large quantities of process water into the stream. The plaintiffs recovered damages for injury to their crops and land on the grounds of nuisance and negligence for the wrongful pollution of the river by the defendants. It is not a defense that part of the water diverted by plaintiffs was used for non-riparian land because only a lower riparian owner can assert this. An easement along the river granted by plaintiffs to a water control and improvement district, which stated that plaintiffs expected to continue to use the land for farming, did not divest them of such rights and possession to the land as to sever and deprive the rest of the land of its riparian character. (Molica-Fla)

THE BIOTIC RELATIONSHIPS WITHIN WATER BLOOMS,
Wisconsin Univ., Madison. Hydraulic and Sanitary Lab.
George P. Fitzgerald.
D F Jackson, Algae and Man, Plenum Press, New York, pp 300-306, 1964. 7 p, 41 ref.

Descriptors: *Eutrophication, Succession, Water quality, Algal control, Algicides, Dominant organisms, Grazing, Water pollution effects, Diatoms, Chlorophyta, Cyanophyta, Nuisance algae, Wisconsin, Nutrients, Indicator species, Euglena, Chlamydomonas.
Identifiers: *Blooms, *Biotic factors, Species diversity, Lake Waubesa, Lyngbya, Microcystis, Aphanizomenon, Anabaena, Melosira, Ceratium, Oscillatoria, Eudorina.

Algal successions, in which nearly unispecific populations of algae alternate with more highly diversified assemblages of species, are characteristic of more natural aquatic environments as well of impoundments, such as sewage stabilization ponds, with no lack of the usually considered nutrients. The usual sequence of species, especially in eutrophic environments, consists of a vernal bloom of diatoms, an early summer growth of green algae, and a late summer bloom of cyanophytes (blue-green algae). After treatment of a water bloom with algicides to alleviate nuisance conditions, the rapid replacement of dominant algal species by others emphasizes that factors which influence dominance may be very subtle. High pollutional loads from sewage sources not only increase algal growth, but may also influence species composition and algal succession. Evidence suggests that secondary effluents may act to suppress succession and reinforce a reduction in species diversity longer than would normally be expected. Since nutrient status of an aquatic environment does not always explain the composition of a bloom, one must often consider the effects of biotic factors such as grazing by the fauna, activities of bacteria and fungi, and the excretion of biologically active compounds by the algae themselves. AN INTRODUCTION TO THE IDENTIFICATION OF CHIRONOMID LARVAE,
Federal Water Pollution Control Admin., Div of Pollution Surveillance, Cincinnati, Ohio.
William T. Mason, Jr.
Processed Rept Mar 1968.

Descriptors: *Midges, *Systematics, Indicator organisms, Macroinvertebrates, Water pollution effects.
Identifiers: Keys, Photographs, Chironomidae, Head capsule.

Author presents a taxonomic discussion of common species of chironomid larvae, organisms of importance as indicators of polluted water conditions. Taxonomic keys are included for five subfamilies and for 55 common genera and sub-genera of the family, Chironomidae (midges). The report incorporates photomicrographs which illustrate important systematic characteristics of the following subfamilies: Tanypodinae, Podonominae, Chironominae, Diamesinae and Orthocladinae; and for the following genera: Tanypus (2 spp), Ablabesmyia, Procladius, Anatopynia, Coelotanypus, Chironomus, C (Einfeldia), C (Kiefferulus), C (Dicrotendipes) (2 spp), C (Cryptochironomus) (4 spp), C (Endochironomus), C (Tribelos), C (Xenochironomus) (2 spp), Goeldichironomus, Glyptotendipes (2 spp), Pseudochironomus, Polypedilum, Paralauterborniella (2 spp), Stenochironomus (3 spp), Stictochironomus, Microtendipes, Tanytarsus, Zavrelia, Micropsectra, Diamesa (2 spp), Prodiamesa (2 spp), Orthocladius (2 spp), Trichocladius, Nanocladius (2 spp), Smittia, Brillia (2 spp), Cardiocladius, Psectrocladius (3 spp), Metriocnemus (2 spp), Diplocladius, Cricotopus (2 spp), and Corynoneura. METHOD OF AND MEANS FOR DEALING WITH STORM-WATER OVERFLOWS IN SEWERS AND LIKE DRAINAGE SYSTEMS.
Longwood Engineering Co., Ltd.

Brit Patent 1,023,311.

Descriptors: *Storm runoff, *Overflow, *Sewers, *Drainage systems, Outlets.
Identifiers: *Suspended solids.

The equipment claimed for dealing with storm-sewage overflows in sewerage and other drainage systems comprises a bay fitted with a trough or channel which has walls of unequal height and a mouth covered with a filter screen which can be cleaned by a rake or rakes rotating in the direction of flow of water through the bay. Under normal conditions of flow, water passes through the bay direct to the foul sewer, but under storm conditions the increased flow causes a build-up of pressure in the bay so that water and floating trash flows over the lower wall of the trough and through the screen to the storm-sewage outlet; trash is swept from the screen by the rake (s) over the higher wall into a trash pit and thence to the foul sewer.
W69-01690

TECHNICAL COMMITTEE ON STORM OVERFLOWS AND THE DISPOSAL OF STORM SEWAGE.

London, Ministry of Housing and Local Government, 1963. 16 pp.

Descriptors: *Storm runoff, *Overflow, *Discharge (Water), Sewage treatment, Design.
Identifiers: *Suspended solids, *Storage tanks.

In the interim report of the Technical Committee which was set up in May 1955 to study and report on storm overflows and the disposal of storm sewage, present practice in the discharge of storm sewage is reviewed; investigations are reported on storm water in 3 drainage areas, Northampton, Brighouse, and Bradford, on the use and operation of storm tanks at sewage works in Tunbridge Wells and Stoke-on-Trent, and on the characteristics of different types of storm overflow; and preliminary conclusions are drawn, particularly with regard to the volumetric setting of storm overflows, the design of overflows to reduce pollution (by providing storage for the first flush of storm sewage and minimizing the amount of floating and heavy-solid polluting material in the overflowing sewage), and the treatment of storm sewage at the sewage works. It is recommended that each sewerage authority should review existing arrangements for the disposal of storm sewage, and the information required in making this assessment is listed.

OPERATING EXPERIENCES AT SWINDON, 1962 - 1967,
W. F. Carmichael.
Meeting of the Institute of Water Pollution Control, Central Southern Branch, March 27, 1968.

Descriptors: Storms, *Automatic control, Sewage treatment, *Equipment, *Overflow, *Storm runoff.
Identifiers: *Storage tanks, Capacity.

The sewage plant, its equipment, and operation are described. In dry weather, only one screen is used. It is operated by a time-clock for five minutes in every fifteen. In time of storms both screens are operated continuously by hand. There are 2 No. detritors with vortex grit washers. Both detritor scrapers, air lift pumps and vortex washers are operated continuously. Three stormwater overflows are controlled by an automatic penstock and standing wave flume. All overflows discharge into a single circular stormwater tank 200 ft. in diameter and of 2 mil. gal. capacity. Effluent from this tank overflows onto 11 acres of underdrained stormwater land.

WATER POLLUTION R AND D GRANTS.

Environ Sci Technol, Vol 1, No 3, p 189, March 1967.

Descriptors: *Grants, *Water pollution control, Overflow, *Automatic control, *Flow control, Storm runoff.
Identifiers: *Combined sewers, *Storage tanks, *Sewer-within-sewer.

Approximately $20 million in contracts and grants were awarded in 1966 by the Federal Water Pollution Control Administration. About half the total was for studies of improved methods for dealing with overflows from combined sewers. Nine cities were awarded a total of slightly more than $8 million to help finance such projects as construction of large detention basins to hold combined sewer overflow prior to treatment, and for installation of automated sewer regulator stations designed to provide better control of combined flows. Contracts of $1.6 million were awarded to private companies to study such possibilities as building a sewer within a sewer or constructing submerged containers capable of holding combined sewer waste until it can be pumped back to the treatment plant.

SEPARATING STORM AND SANITARY SEWERS IN URBAN RENEWAL.

32nd Report by the Committee on Govt Operations, US House of Representatives, House Rept 1648, US Govt Printing Off, Washington, DC, June 23, 1966. 20 p, 2 tab.

Descriptors: *Water pollution, Grants.
Identifiers: *Storm sewers, *Sewer separation, *Combined sewers, Urban drainage.

The need for separating storm and sanitary sewers is discussed, with emphasis on separating such sewers in areas being developed or redeveloped under federal aid. The 1962 Public Health Service Table on number and size of communities served by combined sewer systems is given. A 1964 Public Health Service appraisal of combined sewers is outlined. Demonstration grants to develop measures to control pollution from combined sewers are described. Problems and controversy concerning separation of sewers in the University-Euclid urban renewal project in Cleveland are discussed and other sewer programs are outlined.
W69-01723

DISPOSAL OF MUNICIPAL SEWAGE (WATER POLLUTION CONTROL AND ABATEMENT).

House of Representatives Union Calendar No 90, 89th Cong, 1st Sess, Rep No 204, 1965. 40 pp.

Descriptors: *Water pollution, *Storm runoff, *Overflow.
Identifiers: *Combined sewers.

This is the 12th report of the U.S. Committee on Government Operations and is based on a study made by its Natural Resources and Power Subcommittee to examine whether Government agencies are coping effectively with water pollution problems and to determine possible improvements in techniques for preventing and controlling pollution of rivers and other water resources. The present position and problems of sewage disposal are reviewed in relation to water pollution, including the problems caused by combined sewerage systems and storm-sewage overflows, and recommendations are made for future action by Government departments; comprehensive planning and co-ordination of sewage-treatment facilities for municipal areas; and development of new methods of sewage treatment.

ELIMINATION OF MARGINAL POLLUTION--JAMAICA BAY.

Report to Dept of Public Works, New York City. Greeley and Hanse, Engineers, (No date).

Descriptors: *Deterioration, *Water quality, *Overflow, Recreation facilities, *Storm runoff, *Water pollution, Sewage treatment, *Chlorination, Sedimentation, *Estuaries.
Identifiers: *Combined sewers, *Storage tanks, *Jamaica Bay (N. Y.).

This report demonstrates the general relationship between deterioration of beach water quality after heavy rains from overflows of mingled sewage and storm water. Recommendations for specific area corrections are detailed - mainly attempting to develop a system of separate sewers to replace existing and overloaded combined sewers. Recommendations would localize potential pollution from storm water overflows to seven areas where storm water overflow treatment works are suggested. Overflow treatment to consist of large holding basins to capture the overflow, permit sedimentation and chlorination prior to ultimate discharge to Jamaica Bay or pumping to sewage treatment plants.
W69-01792

DESIGN CRITERIA FOR INTERCEPTOR SEWERS FOR ST LOUIS,
Erwin E. Bloss.
ASCE Proc, J. Sanit Eng Div, Vol 92, No SA4, Proc Paper 4877, pp 7-31, Aug 1966.

Descriptors: *Design, Pumping, Sewers, *Water pollution control, *Storm runoff, Overflow, *Construction costs.
Identifiers: *Interceptor sewers, *Combined sewers, *Capacity, *St. Louis (Mo).

Preliminary to the sizing of the sewers, pumping stations, and treatment plants of the Metropolitan St. Louis Sewer District's Mississippi River Pollution Abatement Project, it was necessary to adopt a design criterion for the interceptors on the combined sewers. The amount of pollutional load spilled to the river during storm water runoff was computed for interceptors of three different capacities when functioning under rainfall conditions corresponding to those experienced during 1955. Pollution was measured in terms of 'equilvalent hours of sewage flow.' It was found that with interceptors having a capacity of 1.0 times peak sewage flow, 3.1% of the total yearly sewage flow would be spilled during storm water runoff. Furthermore, the efficiency of the overall project after primary treatment would be approximately 0.25% less with interceptor capacity of 1.0 times peak sewage flow than with interceptor capacity of 1.25 times peak sewage flow, whereas the increase in cost of the project, using the larger interceptors would have been on the order of $2,800,000. The smaller size interceptor was adopted.

STORM WATER FLOW SELECTION METHOD ELIMINATES SILT PROBLEM,
G. Chanin.
Water and Sewage Works, Vol 102, No 8, pp 300-3, July 1955.

Descriptors: *Storm runoff, *Storm drains, Sewage treatment.
Identifiers: *Suspended solids.

New Sewage Treatment Plant in Oakland, California, had disadvantage that large volumes of storm water with fine sand and silt reached it so that sludge collectors were completely covered; to eliminate this, channel was constructed to by-pass storm waters; requirements for test to determine whether sand and silt are present and whether by-pass gates should be opened.
W69-01804

POLLUTION CONTROL MEASURES FOR STORMWATERS AND COMBINED SEWER OVERFLOWS,
D. D. Dunbar, and J. G. F. Henry.
J Water Poll Control Fed, Vol 38, No 1, p 9, Jan 1966.

Descriptors: *Water pollution control, *Storm runoff, *Overflow, *Chlorination.
Identifiers: *Combined sewers, *Storm sewers, *Interceptor sewers, Capacity.

Two primary sources of water pollution other than domestic and industrial wastewaters are the discharges from combined sewer overflows and from separate storm sewer systems. Such overflows can contribute objectionable amounts of pollution to receiving waters. Interceptor and wastewater treatment plant capacity in relation to average dry-weather flow shows that the overall efficiency of raw sewage collection is not improved greatly once such capacity reaches 3 x dry-weather flow. Partial separation of stormwater by collecting street runoff in a collection system independent of an existing combined system markedly increases pollution control efficiency of the existing system; this method is about 40 percent as costly as total separation. Volumetric storage sufficient for a storm of 1.2 in/6 hr (30.5 mm/6 hr) can reduce stormwater escaping treatment from 85 to 40 percent. Chlorination of stormwater runoff or of mixtures of stormwater and raw sewage can reduce effectively bacterial concentrations.
W69-01810

KANSAS CITY'S POLLUTION ABATEMENT PROGRAM,
G. J. Hopkins.

Water Pollut Contr Fed J, Vol 39, No 9, pp 1487-1503, Sept 1967.

Descriptors: *Water pollution control, Sewage sludge, Sewage treatment, *Storm runoff, Pumping, *Overflow.
Identifiers: *Combined sewers, Sewer separation, *Kansas City (Mo.), Missouri River.

Kansas City, Mo., is carrying out a $75 million program to abate pollution of the Missouri River and its tributaries in the area. The program is financed by revenue bonds supported by a sewer service charge. The plan is geared to joint use of facilities by Kansas City and the numerous adjacent municipalities. Primary treatment of all wastewater is now in effect. The facilities now completed include four treatment plants and a number of pump stations, force mains, and interceptor sewers. Sewers will be extended to presently undeveloped areas. Unusual features include a sewer river crossing, use of an abandoned water main as a sewer force main, and pumping of sludge 7 miles (11.3km) for treatment at a central facility. Waste treatment is unlikely to provide a total solution to the Missouri River's water quality problems. There is no demonstrable need or economic justification for stormwater separation for the Missouri River. Quality of stormwater overflows may compare favorably with that of the receiving water. These overflows occur less than four percent of the time and their pollutional significance has not been demonstrated.

Gas Wasserfach, Vol 108, pp 43-45, 1967.

Descriptors: *Highways, *Runoff, *Water pollution, *Storm runoff.
Identifiers: *Storm sewers, Capacity, *Oil pollution.

In connexion with the prevention of pollution by oil, deposited on motorways by the increasing number of oil tankers, and washed-off into the receiving waters by rainfall, detailed studies were carried out by the Ruhrverband on the Westhofer motorway between Remscheid and Kamen. Oil-separator tanks have been installed along sections of the new motorway before the storm sewage enters the receiving water to protect numerous water works in the lower and middle Ruhr, which serve a large community. Based on the specifications DIN 4040 and 4043 of the Ruhrverband, these tanks are constructed for a surface loading of 12 m per hour and a retention period of 10 min; the calculation of the run-off is based on 100 litre per second per hectare. The run-off values and time factor are adjusted to local conditions. Seccessful operational results showed that 6 months after installation a 4-cm deposit of sludge and 1-2m (to the third power) of sand had collected from each influent and these were easily withdrawn by suction pumps. Tabulated data are included and a map shows the areas selected for present and future positions of separator tanks.

NATION'S CAPITAL ENLARGES ITS SEWERAGE SYSTEM,
C. Frank Johnson.
Civ Eng, Vol 28, No 6, 1958.

Descriptors: *Water pollution, *Overflow, Recreational facilities, *Pumping, *Storm runoff.
Identifiers: *Interceptor sewers, *Combined sewers, *Washington, D. C., *Sewer separation.

Pollution from combined sewer overflows is prohibiting the use of Potomac and Anacostia Rivers and Rock Creek in Washington, D.C. for many recreational uses. A $151,000,000 improvement program is recommended, mostly for relief sewers and pumping stations. Some of the interceptors are so inadequate that they overflow even in dry weather. The separation of all sewers was considered but concluded to be too costly. Alternate plan is to construct large enough relief sewers that overflows into Rock Creek will have a dilution factor of 200 and Upper Potomac 30 before overflowing. This represents a storm of 2 year frequency.
W69-01829

CHEMICAL CONTROL OF WATER QUALITY IN A TIDAL BASIN,
M. Lang.
J Water Poll Control Fed, Vol 38, pp 1410-1418, 1966.

Descriptors: *Storm runoff, *Overflow, *Water pollution, Sewage treatment.
Identifiers: *Intercepting sewers, Bergen Basin (N Y).

Bergen basin, a small arm of Jamaica Bay, N.Y., is a tidal basin with no surface-water tributaries, but it receives discharges of storm sewage when the capacity of the nearby Jamaica sewage works is exceeded during storms, and at times in hot weather there has been slight odour nuisance. In 1963, when alterations were being made to the sewage works, all the plant effluent was discharged to the basin for 2 weeks; at this time the influent sewage was septic, having been stored in the intercepting sewers for some months while the alterations were in progress, and this caused severe pollution of the basin with very strong evolution of hydrogen sulphide. In an attempt to improve conditions, bulk sodium nitrate was added to the basin to create aerobic conditions in the bottom deposits and sodium hypochlorite solution was also added to oxidize the hydrogen sulphide in the water; these measures proved effective, and subsequently addition of hypochlorite was discontinued, but sodium nitrate is still being added to the basin.

ADMINISTRATIVE AND FINANCIAL ASPECTS OF OPERATING A METROPOLITAN SEWER DISTRICT,
Metropolitan St Louis Sewer Dist, St Louis, Mo.
P. F. Mattei, and C. B. Kaiser.
Water Pollut Control Fed J, Vol 39, No 4, pp 501-517, April 1967.

Descriptors: Watersheds, *Storm runoff, *Water pollution control, *Construction costs, Outlets, Drainage systems, Sewage treatment.
Identifiers: *Urban drainage, *Interceptor sewers, *St. Louis (Mo).

The organization and financing of the 12 yr. old Metropolitan St. Louis Sewer District are described. A watershed by watershed study was made to determine the stormwater problem and results have shown what the district needs but the more than a hundred million dollar overall cost necessitates a piecemeal approval, dealing with the worst problems through subdistrict programs and self-help programs. To relieve pollution of the Mississippi by sewage, construction of an interceptor sewer picking up all of the wastewater outlets along the river was begun as well as construction of two large primary treatment plants. Problems and possible solutions for financing the needed stormwater facilities are discussed.

THE MINNEAPOLIS-SAINT PAUL SANITARY DISTRICT - OPERATION AND EXPANSION,
K. L. Mick.
Water Pollut Control Fed J, Vol 39, No 10, pp 1684-1700, Oct 1967. 1 fig, 3 tab, 6 ref.

Descriptors: *Sewage treatment, Grants, *Overflow, Construction costs, Water pollution.
Identifiers: *Interceptor sewers, *Storm sewers, *Combined sewers, Minneapolis-St. Paul (Minn).

Results of a 1956-60 study of the Minneapolis-St. Paul Sanitary District called for central treatment of wastewater at the existing plant, plant expansion, and interceptor sewer construction. Estimated costs are given. Expansion of the existing primary plant is discussed. A study on the combined sanitary and storm sewer problem was also included. The study recommended that a system of power-operated gates be installed on 15 key regulators, with gate positions and levels in major sewers telemetered to a central control point. These 15 diversion points accounted for about 80 percent of the overflow to the river in 1960. In 1966 the District received a Federal demonstration grant offer of 50 percent for a sewer regulator project estimated to cost $1,741,500. This work will include an evaluation of the effect on river conditions. A supervisory control system will promote maximum utilization of the interceptor sewer and treatment facilities, taking into account rainfall distribution in the area and other factors. It will provide a new technique of instantaneous observation and control of interceptor system performance to minimize overflows to the river.
W69-01838

DISCHARGE OF RAIN WATER FROM URBAN SEWERS INTO STREAMS,
M. Negulescu, and I. Rabinovici.
Hidrotehnica, Vol 9, pp 205-209, 1964.

Descriptors: *Storm runoff, *Water pollution, Discharge (Water), *Water pollution control.
Identifiers: *Urban drainage, *Combined sewers, *Storage tanks.

It is indicated that rain water discharged from combined or separate sewers in urban areas can have as great or even double the polluting effect of domestic sewage and can damage the receiving stream particularly if the areas are industrial. Storage reservoirs along the sewerage system or as part of the treatment plant are suggested as a means of protecting streams.
W69-01841

THE BATTLE TO SAVE LAKE MICHIGAN,
H. W. Poston.
Civ Eng, Vol 37, No 12, pp 40-43, Dec 1967.

Descriptors: Sewage treatment, *Overflow, *Water pollution control, *Flow measurement, Storm runoff.
Identifiers: *Combined sewers, *Interceptor sewers, *Storage tanks, *Chicago (Ill), *Lake Michigan.

As a result of an enforcement conference called by the Federal Water Pollution Control Administration, Indiana communities whose wastes dump into Lake Michigan have already added secondary treatment facilities; detention facilities and combined sanitary-storm sewers are to be built to prevent overflow. Chicago is attempting to solve this problem by retaining storm water overflows in underground interceptor sewers of large diameter 250 ft. deep, where the water can be stored for future treatment. Milwaukee is establishing automatic monitors along the Milwaukee River to measure the average yearly flows and peak flows of the sewer system as affected by rainfall in an attempt to locate critical points where control facilities should be installed. In addition, a 3.8 million gallon underground detention tank will be constructed to trap storm overflows, which will be retained for subsequent treatment.
W69-01845

STRATFORD-UPON-AVON SEWAGE WORKS.

Wat Poll Control, London, Vol 66, pp 268-269, 1967.

Descriptors: *Storm runoff, Treatment, Land use.

A description is given of the new Milcote sewage works of Stratford, Warwickshire, which provide complete treatment for a dry-weather flow of 1.55

m.g.d. by biological filtration with recirculation of effluent. Sludge is digested and disposed of on land; drying beds are available for dewatering excess sludge. About 1 acre of underdrained land is also available for treatment of storm sewage or for further treatment of final effluent if necessary.
W69-01855

WINDSOR STARTS POLLUTION CLEAN-UP.
Wat Poll Control, Ontario, Vol 104, No 5, pp 23-27, 1966.

Descriptors: *Storm runoff, Sewage effluent, Chlorination.

Treatment facilities provided at the Little River Sewage Works at Riverside, Windsor, Ontario, are outlined and illustrated. The plant, which serves Riverside and Sandwich East, has a capacity of 4 m.g.d., with space available for future expansion; it provides complete treatment by the activated-sludge process. Excess storm sewage and final effluent are chlorinated before discharge to the Little River, while crude primary and excess activated sludge are conditioned with ferric chloride and lime, dewatered on an automatically-controlled vacuum filter, and used as land-fill.
W69-01856

CITY OF MILWAUKEE.
Water Wastes Eng, p 118, (n.d.).

Descriptors: *Overflow, *Storm runoff, *Chlorination.
Identifiers: *Combined sewers, *Storage tanks, Milwaukee (Wis).

Milwaukee is constructing an underground concrete tank to catch rainstorm overflow from the combined sewer system. The demonstration tank will be 170 ft. long, 130 ft. wide and 30 ft. deep and will hold 3,900,000 gal. The tank will be designed to catch the run-off, purify it with chlorine or hold it until the storm ends. Then it will gradually drain the run-off back into the combined sewer system, which flows to the sewage treatment plant.
W69-01857

TREATMENT OF OVERFLOWS FROM COMBINED SEWERAGE SYSTEMS BY USE OF STORM WATER STORAGE AND CHLORINATION.

New Hampshire Water Pollution Commission Staff Report No 40, March 1959.

Descriptors: *Overflow, *Storm runoff, *Chlorination, Water quality, Recreation facilities.
Identifiers: *Combined sewers, *Storage tanks.

A study of a procedure to treat enough of the storm water overflow from an adequate combined system to achieve B-1 quality in a receiving water nearly 100% of the summer bathing season. Assumptions and procedure are detailed.
W69-01858

BACTERIAL REDUCTIONS IN THE CHLORINATION OF SEWAGE--EFFECT OF AGITATION.

New Hampshire Water Pollution Commission Report No 3, Staff Report No 42, March 1960.

Descriptors: *Chlorination, *Sewage effluents, *Coliforms, Sewage treatment.

Report covers three studies on the bacteriologically acceptability of effluents which have been chlorinated with doses of 30 to 40 ppm with gentle stirring after comminution. Study 1: Determined if there exists a practical level of chlorination of raw sewage that 99 percent of time with 15 minute chlorine contact and without settling can be relied upon to produce ultimate coliform bacterial counts in the effluent not to exceed 240/100 ml even when such effluent is subsequently subjected to rigorous breakup of particulate matter. Finding -- At practical chlorine dose levels of 40 ppm or less simple chlorination of unsettled raw sewage cannot be relied upon.
W69-01859

SYSTEM STUDY, DESIGN, AND EVALUATION OF THE LOCAL STORAGE, TREATMENT AND REFUSE OF STORM WATER.
Hittman Associates, Inc.

Final Report - Contract No 14-12-20 with the Federal Water Pollution Control Administration, August 1967, 5 p.

Descriptors: *Storm runoff, *Treatment, *Water reuse, Sampling, Computer programs.
Identifiers: Columbia (Md), *Storage tanks.

An $850,000 two-year program is suggested for the collection of stormwater runoff in three small storage basins and pretreatment units in the new city development of Columbia, Md., the treatment of this runoff to remove pollutants, and its further treatment for potable reuse. A packaged water treatment plant would be used to determine the technical and economic feasibility of such treatment. Gaging and sampling stations, and a connection to the public water system, are included in the plan. A computer-generated cost-benefit analysis was used to determine such facets as optional size of storage reservoirs and optional system configuration. A 'Study of Reuse of Storm Water', by Whitman, Requardt and Associates, indicating various consumptive (e.g., toilet flushing) and non-consumptive (e.g., fire protection) re-uses, forms part of the Appendix.
W69-01860

PROTECTING THE POTOMAC AT WASHINGTON,
D. V. Auld.
J Water Poll Control Fed, Vol 37, pp 275-291, 1965.

Descriptors: *Water pollution control, Water quality, *Chlorination, *Storm runoff, Sewers, Estuaries.
Identifiers: *Combined sewers, *Sewer separation, *Potomac River, *Storage tanks.

To reduce pollution of the Potomac river in the Washington metropolitan area, several counties, cities and towns have formed an informal organization that has adopted water quality objectives for 63 miles of the river, agreed that there should be neither treated nor untreated waste discharges for some 38 miles above the head of tide-water, and established a Regional Sanitary Advisory Board which has developed a comprehensive plan for sewage disposal. As part of this regional effort, the District of Columbia is provided sewerage facilities for much of the surrounding territory, including the new Dulles International Airport in Virginia. The sewage works have been expanded to provide secondary treatment by the highrate activated-sludge process, and it is planned to provide preliminary tanks and chlorination facilities for storm flows in excess of those receiving complete treatment. The new sewerage facilities are on the separate system, and work has already begun on converting the older parts of the system from the combined to the separate type.
W69-01861

CHICAGO MSD PROGRESS REPORT ON CHLORINATION,
Metropolitan Sanitary District of Greater Chicago, Chicago, Ill.
Vinton Bacon.
Water Sewage Works, pp 350-351, Sept. 1967.

Descriptors: *Chlorination, Sewage treatment, *Construction costs.
Identifiers: Capacity, *Chicago (Ill).

It has been possible to complete chlorination facilities for the North Side Sewage Treatment Works 1 1/2 years ahead of schedule, by utilizing the effluent conduit and the North Shore Channel for the contact basins, thus obviating long and costly construction. The cost of this project was a dramatically low $162 per mgd capacity, in contrast to $8,380 per mgd capacity for other plants. At the rated capacity of 300 mdg, a 9-minute detention is achieved in the effluent conduit. Chlorine dosages of 1.8 mg/l are being used for initial operations.
W69-01862

CHICAGO METRO SANITARY DISTRICT MAKES NO LITTLE PLANS,
V. W. Bacon, and F. E. Dalton.
Pub Works, Vol 97, No 11, pp 66-70, 140, 142, 1966.

Descriptors: *Water pollution control, Sewage sludge, *Storm runoff, *Overflow, *Chlorination, Sewage treatment.
Identifiers: *Combined sewers, *Storage tanks, *Chicago (Ill.), Sewer separation, *Rapid filter.

Because of increased demands on treatment plants and higher environmental standards, various solutions are considered for easing the pollution problem in the Chicago area, including the use of long transmission lines to discharge digested sludge to large areas of marginal agricultural soil and to coal strip mines. Also considered is the underground storage of contaminated storm-sewage overflows from combined sewers; storage would be in a system of tunnels and large chambers excavated in solid rock deep under the city, and the sewage would be pumped to the surface for treatment after storms, a more economical solution than the provision of separate sewers. As a temporary solution the District is experimenting with the chlorination of storm-sewage overflows. A brief report is given on the need for tertiary treatment; a 2-m.g.d. plant will be installed as an experiment at the District's Hanover Park plant to provide tertiary treatment by coagulation, chlorination, rapid sand filtration, and final aeration.
W69-01863

THE ST JOSEPH, MISSOURI WATER POLLUTION CONTROL PROGRAM,
R. L. Brown, and W. R. Condon.
J Water Poll Control Fed, Vol 39, pp 1374-1380, 1967.

Descriptors: *Water pollution control, *Storm runoff, *Sewage treatment, Sedimentation, Sewage sludge, Maintenance.
Identifiers: *Combined sewers, St. Joseph (Mo).

To reduce pollution of the Missouri river, a sewage works is being constructed at St. Joseph, Mo., to provide treatment for combined sewage and storm water by aerated grit removal, sedimentation, and sludge digestion. Digested sludge will be dewatered by vacuum filtration, but provision has also been made for dewatering on sand beds or for disposal of liquid sludge on farmland. The operation and maintenance of the sewerage system are described.
W69-01866

CHLORINATION OF MIXED SEWAGE AND STORM WATER,
T. R. Camp.
ASCE Proc, J Sanit Eng Div, Vol 87, No SA 1, 1961.

Descriptors: *Chlorination, *Storm runoff, Outlets, Sewage treatment, *Biochemical oxygen demand, *Pathogenic bacteria.
Identifiers: *Suspended solids, *Combined sewers.

The author deplores the present tendency to concentrate on primary treatment of sewage to reduce the B.O.D. and the concentration of suspended solids, while overlooking the need for destruction of pathogenic bacteria and viruses. In older communities with combined sewerage systems about 3

per cent of the sanitary sewage is discharged with storm water through storm-water outfalls, and this should also receive treatment to remove bacteria. The author describes experiments carried out on the chlorination of sewage alone and in admixture with storm water. The results indicate that such treatment is effective. The amount of chlorine required for disinfection of storm water would be about 50 per cent more than the amount required for treatment of the dry weather flow alone.

WEST BRIDGFORD'S 1897 SEWAGE WORKS WILL BE MODERNIZED BY 1964,
R. Dewsberry.
Munic Eng, Vol 139, p 1277, 1962.

Descriptors: Sewage treatment, *Storm runoff, Pumping.
Identifiers: *Storage tanks.

Mining subsidence prevented the building of a new sewage plant for West Bridgford, and it was decided to convey all sewage to the Nottingham treatment plant. The district, which has a population of 3500, has been divided into five new drainage areas. All sewage will be collected at a new main pumping station, and storm-water tanks and an outfall to a watercourse will be provided for high flows.
W69-01870

BIOLOGICAL FILTRATION USING A PLASTIC FILTER MEDIUM,
Water Pollution Research Laboratory, Stevenage, Gt Brit.
G. E. Eden, G. A. Truesdale, and H. T. Mann.
Inst Sewage Purif, J and Proc, Pt 6, pp 562-574, 1966. 3 tab, 7 fig, 7 ref.

Descriptors: *Sewage treatment, Biochemical oxygen demand, Sewage effluent.
Identifiers: *Suspended solids.

Experiments in the use of the Dow 'Surfpac' fabricated plastic medium for use in percolating filters are described. The material was tested in comparison with 2 1/2 in. rounded gravel, and with granite and at various rates of sewage application and BOD loads. It seems clear that effluents of high quality cannot be expected from media of this type; their advantage seems to lie, rather in their ability to accommodate large volumes of film and to permit the rapid passage of suspended matter, as in the treatment of unsettled liquids.
W69-01871

SEWAGE TREATMENT. VII. SEPARATION AND TREATMENT OF STORM WATER,
L. B. Escritt.
Contractor's Rec, Vol 59, No 32, p 11, 1948.

Descriptors: Sewage treatment, *Storm runoff, *Flow control.
Identifiers: *Storage tanks.

Methods of dealing with storm water flow at sewage works with and without storm tanks are described. The design of orifices for control of the flow to the sewage works is discussed.
W69-01872

SEWAGE TREATMENT PROCESSES. IV. STORM TANKS,
L. B. Escritt.
The Water and Waste Treatment J, Vol 6, pp 407-8, Sept-Oct 1957.

Descriptors: *Storm runoff, Pumping, *Flow control, Sewage treatment.
Identifiers: *Storage tanks, *Capacity.

This article deals with the reason for using storm tanks to serve as storage or holding tanks to prevent the discharge of excessive storm infiltration to the treatment works. Points discussed are purpose of storm tanks, theoretical capacity of tanks, storm water separation, storm tank details, and balancing flows from pumping stations.
W69-01873

SEWAGE TREATMENT AT SLOUGH,
John Finch.
Effluent Water Treat J, Vol 4, pp 275-77, June 1964.

Descriptors: *Storm runoff, Sewage treatment.
Identifiers: *Storage tanks.

Sewage treatment works serving the Borough of Slough, next to the lower terraces of the Thames River, are discussed with special emphasis on the design features necessitated by flat topography, high ground water table, and location of the plant site only a few feet above river level. The entire flow is pumped before entry into the plant. The flow is subject to comminution and grit removal. Excessive storm flows are bypassed to storage tanks to be returned to sewage flows when conditions are favorable. Flow is then divided. The high-level plant consists of primary settlement in a circular flow tank, high intensity aeration, effluent treatment by trickling filters, final settling, and disposal to the Thames River. The low-level plant consists of horizontal-flow, rectangular tanks without mechanical sludge removal equipment. Low-level plant flow is divided between standard rate filters and aeration units. When plant modification is complete, the entire flow will be aerated, filtered, and settled. Humus sludge and surplus activated sludge are pumped to primary tanks to be settled out with primary sludge. Sludge is thickened and digested.
W69-01874

COMPLETION OF FURTHER STAGE IN GRANGEMOUTH DRAINAGE SCHEME,
J. M. Fraser.
Consult Engr, Vol 23, pp 550-553, 1963.

Descriptors: *Sewage treatment, Equipment, Discharge (Water).
Identifiers: *Combined sewers.

The new combined sewerage system to serve the Bowhouse area of Grangemouth, Stirlingshire, is described. At the pumping station, flows up to 6 times dry-weather flow are comminuted before discharge to the Forth estuary 270 yards offshore; this volume of sewage will later be treated at a new sewage works which is to be constructed. Flows in excess of 6 times dry-weather flow are screened and discharged to the river Avon.

THE EFFICIENCY OF CONVENTIONAL SEWAGE PURIFICATION WORKS, STABILIZATION PONDS, AND MATURATION PONDS WITH RESPECT TO THE SURVIVAL OF PATHOGENIC BACTERIA AND INDICATOR ORGANISMS,
O. J. Coetzee, and N. Fourie.
Proceedings, Resolutions, and Papers of the Conference on the Problems Associated with the Purification, Discharge and Re-Use of Municipal and Industrial Effluents, Pretoria, 1964, pp 93-108.

Descriptors: Sewage treatment, *Sewage effluent, *Storm runoff, Sewage lagoons, *Bioindicators, *Pathogenic bacteria.
Identifiers: *Bacteriological sampling.

Tabulated and graphical results are presented from studies on the removal of Esch. coli, Salmonella typhi, Pseudomonas aeruginosa, and clostridium perfringens at various stages of the conventional sewage treatment process (using double filtration) and in lagoons. Neither system gave a safe effluent, but the lagoons are considered safer since there were no increases in any species of bacteria at any time. Lagoons have the additional advantage that all crude sewage, even during storms, receives treatment and none is by-passed. Results indicate that Esch. coli is not an infallible indicator for the presence of pathogenic organisms; a new indicator organism is needed and it is considered that an indicator fungus would have certain advantages which are listed.

AUTOMATED PUMPING STATIONS FOR OUR NATION'S CAPITAL,
E. E. Halmos.
Water Sewage Works, Vol 114, No 9, pp 319-321, Sept 1967.

Descriptors: *Automatic control, Sewage treatment, *Storm runoff, Pumping, Sewers.
Identifiers: *Storm sewers, *Interceptor sewers, *Urban drainage, Sewer separation, *Washington, D.C.

Two new installations are described. The Potomac Station is an automated plant which handles sewage and stormwater from the sewage interceptor line serving Dulles Airport and other Virginia and Maryland communities. The 'O' St. Station handles sewage and stormwater from a redevelopment area where 100 acres of slum is being replaced. Both units will eventually bypass the main station which has 4 sanitary pumps operating at near their capacity of 280 mgd; the six stormwater pumps can handle up to 480 mgd. The city has totally separated storm and sanitary sewers. The pumps and the operation procedures of the station are described.

DESIGN AND OPERATING EXPERIENCES AT THE NEW WORSLEY U D C SEWAGE WORKS,
J. M. A. Hope.
J Proc Inst Sew Purif, pp 455-458, 1965.

Descriptors: *Sewage treatment, *Storm runoff, Overflow.

The new sewage works serving Worsley, Walkden, and Little Hulton, Lanes., are designed to treat 1 m.g.d. of mainly domestic sewage by the activated-sludge process with Simplex aeration cones; there are no storm overflows on the sewers near the works and full treatment is provided for flows up to 4 times dry-weather flow and the remainder receives primary treatment. Experiences in the initial operation of the plant are outlined.
W69-01881

EFFECT OF STORAGE AND SKIMMING ON COMBINED SEWAGE OVERFLOWS,
Hubbell, Roth and Clark, Inc., Bloomfield Hills, Mich.
George E. Hubbell.
39th Annual Conference of the Water Pollution Control Federation, Kansas City, Mo, Sept 25-30, 1966, figs, tables.

Descriptors: Drainage systems, *Weirs, Outlets, Flowmeter, Rain gages, Sampling, *Overflow.
Identifiers: *Combined sewers.

The first year's operation of the Twelve Town Drainage District's relief drainage system is reported. A high weir skimming structure at the outlet is described, and flow metering, a rain gage network, and laboratory facilities at the Outlet Structure (including automatic samplers) are noted. Sewage and overflow characteristics are compared, and primary settling is viewed as not likely to produce significant changes.
W69-01882

DESIGNING OF SEWERAGE SYSTEMS,
A. C. Koot.
Water, Vol 51, No 8, pp 165-69, April 20, 1967.

Descriptors: *Design, *Sewers, *Storm runoff, *Overflow.
Identifiers: *Capacity.

The author summarizes the designing of grit chambers, primary and secondary sedimentation tanks, low- and high-rate trickling filters, low- and high-rate activated sludge plants, and digestion tanks. Sufficient storage capacity in or in addition to the sewerage system for storm overflows is also discussed.

CONSTRUCTION AND MAINTENANCE OF SEWERS AND DRAINS.

Mass Ann Laws, ch 83, secs 1-13 (1966).

Descriptors: *Massachusetts, *Administration, *Drains, *Sewers, Legislation, Construction, Maintenance, Repairing, Cities, Administrative agencies, Water pollution, Ditches, Sewerage, Treatment, Facilities, Eminent domain, Obstruction to flow, Sewage disposal, Permits, Government finance, Damages, Administration.

Section 1 authorizes specified municipal officials to lay out such drains and sewers as they deem necessary for public health, and to take land necessary for this purpose by eminent domain. Sections 2 and 3 deal with keeping records of sewer and drain plans, descriptions and repairs, and with sewer connections to houses and buildings. Section 4 provides for construction of ditches and drains for highway drainage, and the taking of land by eminent domain for that purpose. Section 5 requires certain landowners to maintain separate plumbing systems for water and sewage. Sections 6 and 7 deal with the establishment of sewage disposal works and pollution or nuisances caused by them. Sections 8 through 10 set forth regulations regarding sewers and drains. They provide fines as high as $100.00 for excavating public ways for laying or repairing sewers or drains without a permit, obstructing the flow of water in ditches or drains, and obstructing the flow of sewers. Sections 11 and 12 provide fines for refusal to connect with common sewers or to repair private drains. Section 13 vests equity jurisdiction in certain courts to enjoin unlawful use of sewers. (Smodish-Fla)
W69-01926

5F. Water Treatment and Quality Alteration

CHEMICAL EFFECTS OF BOTTOM DEPOSITS ON QUALITY OF IMPOUNDED WATERS,
Massachusetts Univ., Amherst, Dep of Civil Engineering.
Tsuan Hua Feng, and Henry C. Hyde, Jr.
Mass Univ, Water Resources Res Center, Symp Proc, Publication No 3, pp 100-119, June 2, 1967. 20 p, 14 fig, 1 tab, 18 ref.

Descriptors: *Water quality, *Hypolimnion, *Bottom sediments, *Decomposing organic matter, *Laboratory tests, Biochemical oxygen demand, Phosphates, Nitrogen compounds, Dissolved oxygen, Impounded waters.
Identifiers: Biological studies, Biochemical process.

Chemical effects of bottom deposits on water quality in the hypolimnion at 20 deg C were studied in laboratory sediment-water columns. Chemical analyses of both the water and the deposits were made to establish the relationship between the transformations of the chemical constituents in the deposits and the changes of chemical quality of the water. Columns 6 in. in diameter and 4.25 ft high were filled with 4 in. of sediment and 4 ft of tap water and kept in darkness at 20 deg C for 6 mo. The 3 sediment samples were digested sludge from a primary treatment plant, bottom deposits from a pond receiving sewage effluent, and bottom deposits of a river receiving untreated paper mill waste. Chemical analysis data are presented in 1 tab and 14 graphs. BOD decreased in the deposits and remained constant in the water. Nitrogen was concentrated in the top 0.75 in. of the deposits, and nitrate concentration increased to 40-140 ppm in the water columns. Phosphates moved from the deposits into the water. Dissolved oxygen was depleted enough to be harmful to most aquatic life. The most rapid quality depletion was in the first 3 mo. (Knapp-USGS)

THIRTEENTH ANNUAL REPORT, 1963-64.
Mersey River Board.

78 pp, 8 plates, 2 maps.

Descriptors: *Water pollution control.
Identifiers: *Storm sewers, Great Britain.

This report of the Mersey River Board, which is to be superseded by the Mersey and Weaver River Authority, includes a section on the prevention of pollution; a map showing the general condition of rivers and streams in the area, according to a colour-coding scheme; and tabulated data obtained in river surveys. Quarterly chemical surveys of all the major rivers showed a slight improvement in water quality as compared with the previous year and with 6 of the previous 8 years. Sources of pollution and remedial action are outlined and detailed observations are reported on the river Alt, Ditton brook, Sankey brook and Glaze brook. The Board encourages the centralized treatment of sewage in larger plants, the discharge of trade waste waters to sewers, and the construction of separate storm-sewage systems. Observations are being continued on the self-purification and re-oxygenation which occur when a polluted stream passes through a large lake.
W69-01768

POLLUTION CONTROL MEASURES FOR STORM WATERS AND COMBINED SEWER OVERFLOWS,
D. D. Dunbar, and J. G. F. Henry.
Can Mun Utilities (Sewerage Manual and Directory) pp 12-20, 1964.

Descriptors: *Water pollution control, *Storm runoff, *Overflow.
Identifiers: *Combined sewers, *Storm sewers.

Relative importance of other sources of pollution, such as mixtures of storm water runoff and raw sewage being discharged from combined sewer

systems, as well as pollutional capabilities of storm water being discharged from separate sewer systems are assessed, and merits of various control measures examined; review of investigations made to study extent of pollution originating in combined and in separate storm sewer overflows.

RIVER POLLUTION BY STORM OVERFLOWS. AN ATTEMPT AT RATIONALIZATION,
H. C. Gatehouse.
Surv Munic Cty Engr, Vol 123, No 3754, pp 33-34, 37-39, 1964.

Descriptors: *Water pollution, *Storm runoff, *Overflow, Water pollution control, Discharge (Water).
Identifiers: *Combined sewers.

The author criticizes the interim report of the Technical Committee on Storm Overflows and points out various unsatisfactory aspects of the measures recommended for the control of pollution by storm-sewage overflows from combined sewers. He stresses the dangers to health of such pollution, and indicates steps that should be taken to eliminate discharges of untreated storm sewage.

DETOURING CALAMITY IN WATER RESOURCE DEVELOPMENT. A CASE IN POINT: SOUTHEASTERN WISCONSIN,
S. W. Havlick.
Trans Wis Acad Sci Arts Lett, Vol 55, pp 59-76, 1966.

Descriptors: *Water pollution control, Recreation facilities, Groundwater, *Sewers.
Identifiers: *Sewer separation, *Storm sewers, *Sewer infiltration, Milwaukee River (Wis).

After outlining difficulties encountered in the development and management of water resources, including the control of water quality, the author analyses the situation in southeastern Wisconsin with particular reference to the potential utilization of water in the Milwaukee river basin and possible methods for solving the pollution problem. The Milwaukee river is used for industrial water supplies and recreational purposes, but not for potable supplies. Adequate supplies are available from lake Michigan although the costs of treatment are increasing, partly owing to deterioration in water quality. Further deterioration in quality of lake and river water could be prevented by increased waste treatment, separation of sanitary and storm sewers, and climination of ground-water infiltration into the sewerage system. It is also proposed that the increasing demand for recreational facilities could be met by further development of lakes and reservoirs within easy access, and that flood water from a loop of the Milwaukee river could be diverted into lake Michigan and used subsequently to augment the river flow in dry weather.
W69-01821

RIVER-WATER QUALITY CRITERIA IN RELATION TO WATERWORKS REQUIREMENTS,
G. V. Houghton.
Symp on River Management, U. of Newcastle upon Tyne, Sept. 1966.

Descriptors: *Water quality, *Rain, Chemical analysis.
Identifiers: *Storage tanks.

The type of criteria or tests required to provide satisfactory cleanliness for waterworks requirements are reviewed. The equalizing and purifying effects of rain water storage have always been recognized as beneficial, depending on many factors. If there is no storage, the setting of criteria is simplified in that it is known that every peak of river impurity must be handled effectively or else abstraction stopped. Some caution is warranted with toxic substances -nitrates, phosphates and polyphosphates, excremental bacteria, organic content and miscellaneous industrial pollution - since storage can have a profound effect on the concentration of some impurities. The need for sufficiently sensitive and reproduceable analytical procedures is discussed.

FUTURE WATER QUALITY DESIGN,
California State Department of Public Health, Berkeley.
Frank M. Stead.
Journal of the American Water Works, Vol. 59, No 12, December 1967, pp. 1497-1501.

Descriptors: Water quality, *Water pollution, *Water quality management, Stream conditions, Standards, Industrial wastes, Public health, Water pollution sources, Municipal wastes, *Waste water disposal, Benefits.
Identifiers: Pathogens, Pesticide pollutions, Total management, Aquatic system.

Pollution control alone will not preserve water quality in the U.S. because it is based on a concept of disposal of wastewaters from municipalities and industries. In both cases the sewage is no longer wanted, and most often put back into the rivers. With half the total annual water replenishment put to use and converted to wastewater, it is important to consider how much dilution is necessary to keep waters up to present standards. There are three basic choices; (1) discharge the entire waste stream to the ocean or evaporate it, (2) through treatment bring the wastewater up to a sufficient level of quality so that when it is diluted it meets standards for all uses, (3) through treatment bring each individual waste stream up to the standard of quality for a specific use and put resulting 'reclaimed' water to that use directly, without returning it to either surface or ground waters. Current standards concerning pathogens and pesticides have not been given enough study to really indicate possible impairment of human health. What is needed is a new water policy for the U.S. -a policy involving total management of water resources. The entire aquatic system must be analyzed and a new system of distribution in terms of benefits must be devised. (Gargola-Chicago)
W69-01982

WATER QUALITY STANDARDS,
James L. Agee.
Journal of the American Water Works, Vol. 59, No. 12, Dec. 1967. p. 1501-1503.

Descriptors: *Water quality, *Standards, Water pollution, Stream improvement, *Wastewater treatment, Industrial wastes, Water quality control, Municipal wastes, Water pollution sources.
Identifiers: Implementation, Waste treatment plants.

Specific attention is given to certain guidelines issued by the FWPCA. The implementation of standards currently being developed to enhance and preserve water quality will guide the overall water pollution control effort. Specific programs: (1) monitoring streams for standards compliance, (2) monitoring effluents from municipal and industrial waste treatment plants, and (3) periodic review of progress being made to construct needed treatment facilities, will be expanded through joint efforts of state and federal programs. One of the biggest needs in pollution control is efficient municipal and industrial waste treatment plant operation. The area of plant operation has been neglected too long; specific programs to perfect treatment plant operations and surveillance of plant operation are needed if stream water quality criteria are to be satisfied. New or expanded activities activities to deal with pollution from erosion, vessels, and marinas, mine drainage, heat discharges, land and agricultural drainage and nutrient enhancement will have to be developed by state and federal governments to meet future needs. THE WATER RESOURCES OF CHILE,
Resources for the Future, Inc, Washington, D and Inst Latinoamericano de Plan Econ y Socia UNEC for Latin Amer.
Nathaniel Wollman.
Johns Hopkins Press, Baltimore, 1968. 279 p, 6 tab, 3 append, 32 ref.

Descriptors: *Planning, *Metodology, *Economi justification, *Water resources developmen Water policy, Model studies, Irrigation, Wat supply, Mining, Industries, Municipal supplie Water law.
Identifiers: Chile, National water planning study.

The water resources of Chile are examined in detail in a study made to present an example of economic methodology for analyzing national water development planning to engineers, technicians, and administrators. Chile was chosen as an example because of a long tradition of irrigated agriculture and the availability of better hydrological data than can be found elsewhere in Latin America. The model used calculates costs of regulating surface flow to achieve patterns of flow necessary to satisfy regional requirements, including waste dilution to regulate dissolved oxygen, and it calculates waste treatment costs. Total water cost is a function of hydrology and the sum of uses. Future requirements are estimated by projecting population and industrial growth by standard methods. The rate of population growth is 2.43% and GNP growth is 5.5%. There is no foreseeable water shortage in Chile if water supplies are compared with projected requirements. There will be, however, local shortages in drier irrigated areas in the northern provinces. Use of water for agriculture, industry, and municipalities, the cost of water supply and waste treatment, and the effects of shortages are examined in detail. Basic data, including agricultural and industrial production, trends, and predictions, as well as hydrologic data, are compiled in appendixes. (Knapp-USGS)

THE WATER INDUSTRY AND LOCAL GOVERNMENT,
Henry J. Greaser.
Journal of the American Water Works Association, Vol 60, No. 1, January 1965, p 1-5.

Descriptors: *Local governments, Optimum development plans, Project planning, Water resource development, Federal governments, State governments, Financing, Water rates, Federal jurisdiction, Inter-agency cooperation, Institutional constraints, *Water policy, Water management.
Identifiers: National Water Policy, Guidelines.

The National Water Policy of the American Water Works Association states that the responsibility for water resource development should rest with that echelon of government or private interest closest to the people. The cost should be borne proportionately by those who are benefited. The federal government should only assume the initiative in water resource development when: (1) the project involved is of such magnitude as to beyond the capacity of local groups, (2) a project so complex that no clearly defined local or state group can be identified as principal beneficiaries, (3) federal participation is necessary to assure maximum feasible development in keeping with the comprehensive regional or basin plan, and (4) the programs and projects are not competitive with alternative means of developing water resources by state, local, or private initiative. The state role is clearly delineated in terms of initiative in developments of cooperative water supply projects between agencies of local and federal government. The local systems should bear the primary responsibility for planning, financing, and operating systems for public and industrial water supply. In regard to the funding of projects, criticism of present water rate practices is presented. Now is the time to begin to sell realistic values for water development and water pollution. Everyone in local, state, and federal agencies should seek financial courses which work toward establishing a stable and self-supporting local water and sewage utility and the best way to begin is to get them to pay their own way. (Gargola-Chicago)
W69-01983

TOTAL MANAGEMENT OF WATER RESOURCES,
Office of Science and Technology, Washington, D. C.
Robert L. Smith.
Journal of the American Water Works, Vol. 59, No. 11, November 1967, p 1335-1339, 2 ref.

Descriptors: Economic efficiency, Social needs, Water allocation, *Adminiatrative decisions, *Institutional constraints, Optimum development plans, Multiple purpose, Project planning, Regulation, Local governments, State governments, Several values, *Administration, Adoption of practices, *Non-structural alternatives.
Identifiers: Alternative policies, Total management.

Water management cannot aspire to the fulfillment of all society's demands. What is sought is a rational basis for choice and a maximum of flexibility to cope with changes in the services demanded and in the priority that society accords them. The federal government is now the major financier of water development projects; water management must be responsible, however, to a unique combination of hydrologic, economic, and social needs of much smaller areas. For this reason project details and specific regulatory decisions are based on regional or local conditions, and fall to the jurisdiction of the state. To operate effectively within this jurisdictional structure, an organization involved in water management must have an adequate financial base and a multipurpose water authority. Everyone seems to support the need for planning in water management, but planning is seldom employed in the development of organizational patterns. Total management should prepare optimum plans for alternative objectives, but the final choice should be exercised by society through the democratic process. It may be asserted that there can be no approximation to total management without an organization whose structure is based on institutional, economic, and jurisdictional, as well as hydrologic considerations. Management must be oriented toward planning responsive to subjective values as well as environmental factors. (Gargola-Chicago)

ALLOCATION OF STORM DRAINAGE COSTS,
Carl W. Porter.
Pub Works, Vol 94, No 3, pp 164-166.

Descriptors: *Rainfall-runoff relationships, *Storm runoff, *Planning, *Legislation, *Flood control, *Land use, Drainage.
Identifiers: Urban drainage.

Article is portion of 'Paper' presented at 1962 American Public Works Congress. It describes program used in the County of Fairfax, Va. Also states that they are working with U.S.G.S. on a pilot program studying 30 main streams in the County endeavoring to determine rainfall patterns and relate runoff from currently developed areas to storm water runoff. Also have an anti-siltation ordinance with SCS. Article discusses plans and ordinances used to protect the suburban homeowner from inadequate drainage and also protect the downstream property owner from flood damage due to increased runoff from newly developed upstream areas.

MEETING FUTURE WATER REQUIREMENTS THROUGH REALLOCATION,
Colorado Univ., Boulder, Department of Civil Engineering.
J. Ernest Flack.
Journal of the American Water Works, Vol. 59, No. 11, November 1967, pp. 1340-1350, 2 tab, 16 ref.

Descriptors: *Water resource development, Water supply, *Water allocation (Policy), Water requirements, Alternative costs, Market values, *Equitable apportionment, Water law, *Legal aspects, Riparian rights, Stream conditions, Capital, Future planning, Water consumption, Economic efficiency, *Water transfer.
Identifiers: California, South Pacific Region, Area of origin right.

Reallocation of water becomes increasingly necessary as readily available sources are exhausted and surplus water becomes more expensive to develop. Unless new sources of water are developed or consumptive uses drastically reduced, the projections of needed water withdrawals for certain areas cannot be realized. The distribution of water shows the South Pacific region will suffer the most severe deficiency of supply for the future. The relative use of water for residential, agricultural, industrial, and urban purposes is discussed, and possible means of reducing these uses given. In discussing the valuation of water rights for purposes of reallocation eight points are considered: (1) cost of acquisition of the original rights, (2) market value, (3) appreciation and depreciation, (4) sale of stock, (5) alternative costs, (6) capitalized earning method, and (7) value in use. The value of reserved rights now in use in California permits the area of orgin to exercise a type of riparianism. In order to make an economic allocation of water and still retain some protection for counties of origin certain points would have to be established; (1) quantify the area of origin right and give it priority (2) condemnation of water rights, (3) engineering studies to determine water use before and after the transfer, (4) measuring return flow, (5) maintenance of stream conditions and (6) limiting transfers to new users defined in the public interest. (Gargola-Chicago)
W69-01984

WATER PRICING IN RESIDENTIAL AREA,
Charles W. Howe.
Journal of the American Water Works Assn., Vol. 60, No. 5, p 497-501, 1 fig, 1 ref.

Descriptors: Costs, Demand, *Water values, Prices, Competition, *Water demands, *Water costs, Use rates, Market value, Elasticity of demand, Unit costs.
Identifiers: Revenue, Commodity.

A framework is suggested to bring cost-demand considerations together to determine water prices with emphasis on demand for residential water. Applying such a framework to the provision of water service to a residential subdivision involves many complexities. The complexities start with trying to develop a relevant and adequate measure of output and of forecasting water demands. Three measures of demand are discussed: (1) domestic demands on an average annual basis, (2) average summer sprinkling demand, and (3) maximum day sprinkling demand. The amount of water demanded for these purposes is affected by the price charged. In designing new systems or sub-systems that depend on quantity demanded, price is a vital factor. The steps in the design process are: (1) demand forecasts, (2) system design, (3) system costs, (4) pricing, and (5) actual demand. They can be made consistent only if the price demand relationships are taken into account and the proper division made between commodity and fixed charges in the rate structure. (Gargola-Chicago)
W69-01986

BILLING FREQUENCY AND CUSTOMER RELATIONS,
Umbaugh and McQueen, Plymouth, Indiana.
H. J. Umbaugh.
Journal of the American Water Works Association, Vol. 59, No. 6, p 669-674.

Descriptors: Unit costs, Water cost, *Water rates, Water values, Use rates, Public benefits, *Social aspects, Pricing, Economic efficiency, Political aspects, Water users.
Identifiers: *Water billing frequency, Public relations.

Water billing frequency is a judgment decision having many sides, economic, social, and political. In a municipal situation the frequency of billing could be a political decision. Customer relations are greatly affected by this; greater frequency of billing might soften the shock of higher priced service and sewage billing. In smaller communities more frequent billing is influenced by two factors: (1) new sewage plants create a substantial additional burden upon water usage, (2) capital improvement of water facilities can result in a considerable water rate increase. A change from quarterly to monthly billing can help users to adjust to increased costs, especially those on fixed budgets, such as the elderly and welfare recipients. The loss of revenue that could result from a shift to monthly billing is discussed and certain factors of loss mentioned. Greater frequency of billing does allow for better maintenance of the system through early detection of leaks and line losses. The deposit required is discussed and public relation factors considered. Billing frequency should bear some relation to size of billing. In communities where standard charges are less quarterly billing may be quite feasible, but where charges are high and sewage billing on the same account, monthly billing can allow for easier financial adjustments by customers. The ideal situation would be to provide the customer with the billing frequency he finds easiest to adjust to. This is not possible now, but perhaps future developments in technology will allow it. JOHNSON V SEIFERT (RIPARIAN OWNER'S RIGHT TO USE OF ENTIRE LAKE SURFACE).

100 N W 2d 689-697 (Minn 1960).

Descriptors: *Minnesota, Judicial decisions, *Riparian rights, Lake beds, Ownership of beds, Riparian land, *Diversion, *Lakes, Navigable waters, Non-navigable waters.

Plaintiff riparian owner brought suit against defendant co-riparian owner to enjoin his restriction of plaintiff's use of two lakes by maintaining a fence through them, and from withdrawing water from the lakes for irrigation. Defendant had constructed a fence along his property line, through the lakes, cutting off plaintiff's access to the main portions of each lake. Defendant contended that the lakes were non-navigable and that plaintiff only had a right to the use of the water over the property he owned. On appeal, the Minnesota Supreme Court held that riparian rights arose from ownership of the shore, not the lakebed, and that each riparian owner had a right to use the entire surface of the lake in common with other riparian owners. The court expressly overruled Lamprey v Donz 86 Minn 317, 90 NW 578, in holding that whether a lake is navigable or non-navigable does not effect riparian rights. The federal test of navigability is not binding. The court also held that the withdrawal for irrigation was reasonable. Defendant only owed a duty to plaintiff not to unreasonably lower the lake level. (Williams-Fla)

BLAKE V UNITED STATES (OBSTRUCTIONS IN NAVAL ANCHORAGE AREA).
181 F Supp 584-591 (E D Vir 1960).

Descriptors: *Federal government, *Rivers and Harbors Act, Navigation, *Rivers, Oysters, Channels, Leases, State jurisdiction, State governments, Navigable rivers, Compensation, *Bouys, Navigable.
Identifiers: Navigation obstructions.

Libellants in this case were lawful holders of oyster ground leases, issued under the laws of Virginia. These grounds were in the lower York River. The United States Government established, in the same general area, a naval mine sweeping practice area and a naval drill minefield area. Public hearings were held prior to this action, and public notice of the hearings was given, although there was no personal notice to the libellants. Certain portions of libellants' grounds were within these restricted areas, and the stakes and bouys used to mark the boundaries were removed by the Navy. Libellants contended that this action rendered their grounds valueless, therefore constituting a taking for which the Fifth Amendment required just compensation. The court held that even though the markers and bouys were private property as contemplated by the constitutional provision, the federal government has a dominant power over navigation. Thus congress may provide for removal of obstructions to navigation, as in the Rivers and Harbors Act. Such a removal is not a 'taking' requiring compensation. (Williams-Fla)

JOINER OF PARTIES WHEN LITIGATING WATER RIGHTS,
W. Patterson.
Baylor L Rev, Vol 11, No 2, pp 181-192, Spring 1959. 12 p, 18 ref.

Descriptors: *Water rights, *Texas, *Adjudication procedure, Water law, Legal aspects, Water utilization, Natural flow, Diversion, Relative rights, Water users.
Identifiers: *Joinder of parties.

Laws concerning parties litigating water rights controversies are discussed. There are three classifications of parties: (1) 'proper'; (2) 'necessary'; and (3) 'indispensable.' Texas courts have repeatedly treated necessary and indispensable parties alike. Cases which indicate the confused state of the law concerning the necessity or indispensability of parties are considered. The author also discusses class actions in water rights controversies. The Texas law is unclear as to when class actions are appropriate. The author points out that the major cause of the confusion in the law is the inaction of the legislature. (Horner-Fla)

INTERNAL IMPROVEMENT TRUST FUND.

Fla Stat 253 secs 253.01--253.05, pp 1197-1200 (1967).

Descriptors: *Administrative agencies, *Florida, Land management, Land tenure, Conservation, Surveys, *Ownership of beds, Beds, Bays, Beds under water, *Legislation.
Identifiers: Internal improvement trust fund, Tidal lands, Swamp lands.

Florida, by statute, established a distinct trust fund comprised of the title to and revenues from the sale of specified state lands. Swamp and overflow lands held by the state, all land held by right of sovereignty, all internal improvement lands, all tidal lands and other enumerated lands, make up the land holdings of the fund. Title to the land and control and administration of the fund are vested in the governor and the cabinet as trustees. They are required to maintain a land office with complete records on all fund land and to prosecute any suit deemed necessary for the protection and preservation of fund lands. They are responsible for creating a comprehensive plan for management, acquisition, and disposition of state owned lands to insure maximum benefit and use. (Geraghty-Fla)

INTERNAL IMPROVEMENT TRUST FUND.

Fla Stat 253 secs 253.111--253.128, pp 1200-1206 (1967).

Descriptors: Highwater mark, Boundaries (Property), Riparian land, Riparian rights, Sand bars, *Bulkhead line, Hydrographs, *Landfills, Ecology, *Conservation, Recreation facilities, Local government, Wildlife, *Legislation, Dredging.
Identifiers: Internal improvement trust fund.

The trustees, before disposing of land to which they hold title, must afford the county in which such land is situated an opportunity to receive such land for public purposes. However, if a riparian owner shall exist, his right to secure such land shall be prior in interest to the county's. The title to all sovereignty tidal and submerged bottom lands, including islands and sand bars created by dredging, is vested in the trustees of the fund. Before this land can be sold, it must be determined to what extent such conveyances would interfere with the conservation of marine, wildlife or other natural resources. The State Board of Conservation, after hydrographic surveys and ecological studies, makes recommendations to the trustees as to the probable effect on the area's resources. Local governments have the power to fix bulkhead lines subject to approval by the trustees. Once established, any extension creating or filling of land beyond such lines into county waters shall be deemed an interference with navigation. Removal of sand, rock or other material from navigable waters of the state to be used as fill is prohibited unless provided for in a construction permit. Any person, natural or artificial, wishing to construct islands or add to existing lands bordering on or in the navigable waters of the state, must obtain a permit to do so from the county wherein such construction is desired. (Geraghty-Fla)
W69-01934

NTERNAL IMPROVEMENT TRUST FUND.

MATZOK V GLEN COVE YACHT SERVICE REPAIR, INC. (EASEMENT OF ACCESS TO NAVIGABLE PORTION OF STREAM).

189 NYS 2d 249 (Sup ct NY 1959).

Descriptors: *Easements, *New York, *Riparian rights, Dredging, Streams, Navigable rivers, Judicial decisions, *Intertidal areas, Riparian land, Banks.
Identifiers: Upland.

Plaintiffs sought judgment establishing an easement over adjoining property, the purpose being to enforce alleged riparian rights. One of the plaintiffs' predecessors in interest owned upland and part of the foreshore bordering on the creek. The deed to plaintiffs had expressly included riparian rights. After dredging operations no part of plaintiffs' property touched on a navigable portion of the creek. Defendant, who was the successor in interest to the remaining property, filled in the foreshore and created a lot. The court found that the fact that part of a foreshore is owned by another, and filled in by him so as to transform foreshore into upland, does not deprive the owner of adjacent foreshore from asserting riparian rights. An easement was granted allowing access to the navigable part of the stream, but not entitling plaintiffs to unreasonably interfere with the use of the property. (Kahle-Fla)
W69-01943

BOSTICK V SMOOT SAND AND GRAVEL CORP. (RIGHTS OF RIPARIAN OWNERS TO CONTROL THE REMOVAL OF SAND AND GRAVEL).

260 F 2d 534-541 (4th Cir 1958).

Descriptors: Judicial decisions, *Maryland, Virginia, *Dredging, Permits, Legislation, Legal aspects, *Boundaries (Property), Low water mark, *Ownership of beds, High water mark, Riparian waters.
Identifiers: *Riparian owners, Potomac River.

Appellants were owners of property in Virginia on the Potomac River. Appellee was a corporation engaged in dredging and removing sand and gravel from the Potomac River between the low water mark on the Virginia side, which was the boundary line between Maryland and Virginia, and the outer line of the channel on the Virginia side. Appellee worked under a license granted by the United States Corps of Army Engineers, but did not acquire the permission of the appellants. Appellants brought an action in trespass, for nuisance. The court held that appellants were contemplated by the Maryland statute that prohibited removal of sand and gravel from the area in which appellee was dredging, except by riparian owners of land bordering the Potomac River. Appellees, therefore, were liable for damages and for removal of the sand and gravel without appellant's permission. (Sisserson-Fla)
W69-01944

UNITED STATES V BIGAN (VIOLATION OF RIVERS AND HARBORS ACT).

170 F Supp 219 (E D Pa 1959).

Descriptors: *Overburden, *Pennsylvania, Federal government, *Rivers and Harbors Act, Strip mines, Banks, Barriers, Structures, Obstruction to flow, Navigable rivers, Judicial decisions.
Identifiers: Allegheny River, Nuisance, Injunctions.

Plaintiff sought prohibitory and mandatory injunctions against defendant for alleged violations of sections 9, 10, 12, and 13 of the Rivers and Harbors Act. Defendant in carrying on strip mining operations, had deposited overburden on an abandoned road 500 feet above the Allegheny River. Heavy rains subsequently washed the overburden down the bank, carrying uprooted trees and underbrush with it into the river and thereby creating a bar. The court found that section 9, prohibiting constructions in navigable rivers, was not violated. Section 10, also prohibiting obstructions, is penal, and implies intentional acts. It was not shown that defendant willfully intended an obstruction. Defendant did violate the first part of section 13, which makes it unlawful to deposit refuse in navigable waters. However, since defendant had abandoned mining operations, a prohibitory injunction was not granted. Defendant did not violate the second part of section 13, making it unlawful to deposit material on the bank of navigable waters, since the road 500 ft. above the river could not be considered a bank. The bar is not within section 12, which restricts statutory injunctive power to structures in violation of sections 9, 10, and 11. The plaintiff is not entitled to mandatory injunction for removal because it does not appear that the bar is a public nuisance. (Kahle-Fla)

BOARD OF COMM'RS V BARON (DISTRICT NOT ALLOWED TO APPROPRIATE NON-RIPARIAN LAND FOR LEVEES AND DRAINAGE).

236 La 846, 109 So 2d 441-444 (1959).

Descriptors: Judicial decisions, *Louisiana, *Riparian land, *Levees, Administrative agencies, Appropriation, Drainage, Streams, Navigable rivers, Public utility districts, Ditches, Mississippi River, *Eminent domain.

The district commissioners sought to evict the defendant from land appropriated by the district for levees and levee drainage purposes. The defendant lost at the trial court, but the decision was reversed on appeal. The district based its appropriation on a La statute which imposes a servitude in favor of the public upon lands adjacent to navigable rivers and streams for the purpose of constructing and repairing levees, roads and other public or common works. The property in question, however, was adjacent to a man-made drainage ditch which was located over 3 miles from the nearest navigable river or stream. Since the land was not riparian, it could not be appropriated under the statute. (Watson-Fla)

RAND V MILLER (ACTION TO QUIET TITLE TO ACCRETION LANDS SEPARATED FROM RIPARIAN LANDS BY AVULSION).
95 NW 2d 916-920 (Iowa 1959).

Descriptors: Judicial decisions, *Iowa, Riparian rights, Missouri River, *Accretion (Legal aspects), *Alluvion, Navigable rivers, High water mark, Boundaries (Property), Interstate compacts, Channels, *Alluvial channels, Dikes.

Suit to quiet title was brought by an Iowa riparian owner claiming title to certain lands by accretion, deed, and adverse possession. The plaintiff won at the trial court, and the decision was affirmed by the Supreme Court of Iowa. The land in question accreted to the plaintiff's land on the Iowa side of the Missouri River from a period prior to 1912 until the mid-1940's. In 1946 or 1947, the river changed courses detaching the land in question from the Iowa side and attaching it to the Nebraska side of the river. The court held that the plaintiff had acquired good title to the land and it was still his although now on the Nebraska side of the river, the land was identifiable, and the Army Corp of Engineers planned to reroute the river to its former channel. (Watson-Fla)
W69-01951

CITY OF MADISON V TOLZMANN (CITY ATTEMPTING TO REQUIRE A LICENSE TO OPERATE BOAT UPON NAVIGABLE STATE WATERS WITHIN ITS JURISDICTION).
7 Wis 2d 570, 97 N W 2d 513-517 (1959).

Descriptors: *Wisconsin, Judicial decisions, Legislation, *Cities, Mississippi River, Lakes, Rivers, Streams, Taxes, *Navigable waters, *Jurisdiction, Boating regulations, St. Lawrence River, Permits, Fishing, Swimming, Navigation, Skiing, Beds, Ownership of beds.
Identifiers: Public trust doctrine.

The city of Madison, Wisconsin, imposed a fine on the defendant for violation of city ordinances by unlawful operation of a boat upon navigable water subject to city jurisdiction without registration of the boat and not having a life preserver for each person. The Supreme Court of Wisconsin affirmed the portion of the judgment pertaining to the life preservers, but reversed the fine for operating a boat without a license. The Supreme Court held that in view of a constitutional provision that the state should have concurrent jurisdiction over navigable waters leading into the Mississippi and St. Lawrence rivers, even if the state had delegated to the city the authority to enact safety regulations, the city had no implied power to enact, as a means of enforcement of such regulations, a boat registration and licensing ordinance provision which resulted in an exaction of fees for the use of navigable waters which were within the city's boundaries. Beds of navigable waters are held by the state in trust for use by the public, and the trust doctrine applies not only to rivers or lakes forming a common boundary to the state but also to inland navigable meandered lakes. NANTAHALA POWER AND LIGHT CO. V HORTON (CONDEMNATION VALUE OF RESERVED WATER RIGHTS).

249 N C 300, 106 S E 2d 461-467 (1959).

Descriptors: Condemnation, *Condemnation value, Eminent domain, Easements, Legal aspects, *North Carolina, Dams, Backwater, Floods, *Water rights, Mining, Compensation, Impounded waters, Hydroelectric power, Access routes, Judicial decisions, Real property.
Identifiers: Tuckaseegee River, Mineral rights.

A power company condemned easements giving it the right to build a dam on its own property and thereby impound waters which would flood a portion of a tract in which respondents each claimed an interest. The condemnor was ordered to pay $11,500. The rights of all respondents depended upon the legal effect of a deed conveying the fee subject to certain 'exceptions, limitations and reservations' which, entitled the grantor and his successors to the mineral and water rights. Respondents Horton and Stnikeleather were successors in interest of the grantor and grantee respectively. Horton contended that, since he owned the water power rights in the tract, which were all the power company acquired by condemnation, he was entitled to receive the entire $11,500. The court held that the deed in question vested in Horton only such water rights susceptible to development within the tract. The easement condemned gave the Power Company substantially greater rights than were possessed by Horton. The amount of compensation was proportionate to the loss shown to have been proximately caused by condemnation. No evidence was introduced showing Horton sustained more than nominal damages, and hence Stnikeleather, owner of the fee, was entitled to the $11,500. (Bozarth-Fla)

AETNA INSURANCE CO. V WALKER (MEANING OF SURFACE WATERS).

98 Ga App 456, 105 S E 2d 917-921 (1958).

Descriptors: *Georgia, Judicial decisions, Surface drainage, Surface runoff, *Surface waters, *Standing waters, *Spring waters, Insurance, Risks.

Insured, Walker, brought suit against the insurer under a policy protecting his property from all physical loss, subject to certain exceptions, one of which was damage from surface water. The insured claimed he suffered damage from seepage from three subterranean springs which caused waters to stand around and seep into the foundation of his house. The insurer defended the suit on the ground that the damage to plaintiff's property fell into the class excluded from coverage under the policy. On appeal, the Georgia court of appeals, held that the damage described by plaintiff was caused by surface water as contemplated in the policy exception. The court held that surface waters include both rain water and water that arises from springs, which diffuses itself over the ground and neither follows nor gathers itself into a definite channel. NAVIGABLE WATERWAY BETWEEN DEMOPOLIS AND TENNESSEE RIVER AND FLOOD CONTROL PROJECTS ON TRIBUTARY STREAMS OF TOMBIGBEE RIVER.

Ala Const Ammend no 270.

Descriptors: *Alabama, *Legislation, *Administrative agencies, *Financing, Navigable rivers, Rivers, Navigable waters, Flood control, Streams, Channels, Tennessee River, Tributaries, United States, Interstate compacts.

The legislature of Alabama may by appropriate laws authorize the state to engage in works of internal improvement by fulfilling the requirements of local contribution, participation, and cooperation established by the United States in connection with the construction and maintenance of a navigable waterway between Demopolis, Ala and the Tennessee River and the implementation and maintenance of flood control projects on the tributary streams of the Tombigbee River. The legislature may also issue bonds, not exceeding $10 million, pledging the full faith and credit of the state to pay for these projects. The legislature is further authorized to create a public corporation to administer the funds provided. (Watson-Fla)
W69-01966

NUISANCES: MANUFACTURING PLANT NOT A NUISANCE AFTER OPERATING FOR ONE YEAR; DAMAGES ON ACCOUNT OF POLLUTION OR OVERFLOW OF STREAM.
Ala Code, tit 7, secs 1088-1089 (1958).

Descriptors: *Alabama, Legislation, *Water pollution, Overflow, Damages, Flood damage, *Industrial plants, Industrial wastes, Legal aspects.

Section 1088 declares that a manufacturing plant is not a nuisance after operating for one year when it was not a nuisance when the operation began, unless a nuisance results from negligent or improper operation of the plant. Section 1089, however, preserves the right of any person, firm, or corporation to recover damages for any injury sustained on account of any pollution of the waters of any stream or any overflow of the lands of any person, firm, or corporation. (Sisserson-Fla)
W69-01967

WATERSHED CONSERVANCY DISTRICTS.
Ala Code, tit 2, secs 670 (1)- (17) (1958).

Descriptors: *Alabama, *Legislation, *Administrative agencies, *River basin commissions, Erosion control, Flood control, Water conservation, Watersheds (Basins), Water utilization, Watershed management, Soil conservation, Financing, Project feasibility.

The procedure for formation and discontinuance of watershed conservancy districts is given. The districts may be formed to develop and execute programs in the conservation of water, water usage, flood prevention, flood control, erosion prevention, and control of erosion, floodwater and sediment damages. The land embraced in any district must be contiguous and lie within a well defined watershed. To form a watershed conservancy district a petition must first be filed with the board of supervisors of the soil conservation district in which it is located. After the petition is received and adequate notice has been given a public hearing is conducted by the board of supervisors to determine the practicability and feasibility of creating the proposed subdistrict. If approved at the hearing, a referendum will be held within the proposed district to see if a majority of the landowners approve the proposed district. If approved by referendum the watershed conservancy district is created. The powers of the directors and the procedures for their election are given. Procedures for modification of the district and conducting referendums on proposed bond issues are also listed. (Watson-Fla)
W69-01969

ERECTION OF DAMS FOR MILLS, GINS OR FACTORIES.
Ala Code tit 19, secs 34-55 (1958).

Descriptors: Hydroelectric plants, *Alabama, Damages, Flood damage, Dam construction, *Damsites, *Non-navigable waters, Mills, Industrial plants, *Legislation, Eminent domain, Public benefits.

Permission to erect a dam for any mill, factory, or gin across any non-navigable watercourse may be granted to the fee owner of land on one or both sides of the watercourse by application to the probate court of the county where the dam is to be erected. Since the proceeding is eminent domain, the structure must be operated for the public. Upon application and notice to the opposite owner 7 jurors will assess possible damage to surrounding land and the value of one acre of opposite land. If the court finds that no residence, outhouse, enclosure, garden, orchard, or other mill will be overflowed and that health will not be endangered, the application will be granted. The applicant must pay the assessed damages and the value of the acre of land within 3 months or the grant will be revoked. Payment for the acre vests fee ownership in the applicant, but failure to construct and maintain the dam within time limits will cause reversion to the former owner. Permission to raise a dam or put a canal through another's land may be granted under the same proceedings. Failure to comply gives rise to double damages. Landowners may appeal to the Circuit Court as a matter of right concerning damages or by certiorari as to irregularities in the proceedings. (Kahle-Fla)
W69-01970

LEASE OF LANDS UNDER NAVIGABLE WATERS, ETC (DEVELOPING MINERAL, GAS, AND OIL RESOURCES).
Ala Code, tit 26, sec 179 (56 L) (1958).

Descriptors: *Alabama, Legislation, Administrative agencies, Gulf of Mexico, Resources, *Natural resources, Oil, Navigable waters, *Ownership of beds, Riparian rights, Minerology, Conservation, High water mark.
Identifiers: *Mineral rights.

Section 179 (56L) authorizes the director of conservation to lease any lands, rights or interests under any navigable waters of the state, including that in the Gulf of Mexico within the seaward boundary of the state (six leagues from the land bordering the gulf) for the purpose of exploration, development, and production of oil, gas, and other minerals. The department of conservation shall supervise and manage such lands and interests. (Sisserson-Fla)
W69-01971

WELLS, CISTERNS: CARE OF.

Ala Code, tit 37, sec 501 (1958).

Descriptors: *Alabama, *Legislation, Wells, *Well screens, Well regulation, Water wells, Cisterns, Rainwater, Cities, *Mosquitoes, Insects, Drains, Stagnant water, Weed control, Weeds, Surface drainage, Surface waters.
Identifiers: Liens.

All cities and towns of the state have the power to construct repair, and regulate public wells and cisterns. The cities and towns also may compel screening of all wells, cisterns, and other places in such cities and towns where water is collected and mosquitoes or other insects are apt to propagate. The cities and towns are further empowered to compel the proper setting of gutters so as to prevent stagnant water from collecting, and to require weeds to be cut or other things or conditions favorable to the harboring of such insects to be abated. All such work is to be done at the expense of the owner, and if it is not collected a lien will be imposed on the property. (Watson-Fla)
W69-01972

RIGHT OF WAY FOR WATER FLOW CITY CAN ACQUIRE THROUGH EMINENT DOMAIN CONDEMNATION.

Ala Code, tit 37, secs 508 and 510 (1958).

Descriptors: *Alabama, *Legislation, *Cities, Eminent domain, *Right-of-way, Water supply, Sewerage, Drainage, Condemnation, Damages, Judicial decisions.

Whenever the city deems it necessary it can acquire a right of way through private property to obtain a water supply, or for sewage or drainage purposes. The mayor is authorized to purchase the land, or if that is not possible, to acquire by condemnation proceedings. When an appeal is taken by the landowner from a condemnation proceeding it does not deprive the city from entering onto the land for the purposes of the condemnation if all damages have been paid into court and a bond of twice the damages has been given.
W69-01973

SEWERS, DRAINAGE, ETC - GENERAL PROVISIONS.
Ala Code, tit 37, secs 601-607 (1958).

Descriptors: *Alabama, *Legislation, *Sewerage, Sewage disposal, Cesspools, Septic tanks, Sewers, *Cities, Drainage systems, Plumbing, Eminent domain, Surface runoff, Ditches, Sanitary engineering, Storm drains, Canals, Aqueducts, Easements, Channels.

The power to construct and maintain sewers, drainage ditches, canals, etc within and without their boundaries is given to all cities and towns of the state. This power includes the taking of private property when just compensation is first made. The city can extend its sewer system to any point within the county in which it is situated using the power of eminent domain. It can also compel a landowner to drain his land at his own expense. If the landowner does not comply the city can drain the land itself and impose a lien on the property. The city also has the power to prescribe construction standards for plumbing. It may order private or public premises to connect with the city sewer system. If the owner does not comply the city may make the connection at its own expense and impose a lien on the property. Notice must be given to the property owners before any of the above powers are exercised. Notice to non-residents shall be by publication. (Watson-Fla)
W69-01974

MICHIGAN LAWS RELATING TO WATER.
Joint Committee On Water Resources Planning, Lansing, Michigan; Legislative Service Bureau, Lansing, Michigan.

Legislative Service Bur P. No. 42, 415 pp, 1966, Michigan Laws Relating to Water, pp 1-415, 1966. 415 p.

Descriptors: *Michigan, Legislation, *Water resources management, Watershed management, *Administration, Water management (Applied), *Administrative agencies.

This is a complete compilation of all Michigan laws relating to water resources management. Some statutes, such as those on sports fishing licensing, while they do deal with water in a limited sense, were excluded. This compilation was prepared for the Michigan Legislature's Joint Legislative Committee on Water Resources Planning. Some historical notes and cross references are included. Statutes on local government, Great Lakes cooperation, drainage, the Waterways Commission, the Departments of Conservation and Public Health, water and power companies, among various others, are included.

PROPOSALS FOR STUDYING THE FEDERAL-STATE WATER RIGHTS PROBLEM,
Los Angeles Department of Water and Power.
Rex B. Goodcell, Jr.
Journal of the American Water Works, Vol. 55, No. 8, August 1963, pp 957-961, 3 ref, 1 appendix.

Descriptors: Water supply, *Federal-state water rights conflicts, Federal jurisdiction, Water law, Water resource development, Legal aspects, Local governments, Interagency cooperation, State governments, *Water rights, Preferences, Appropriable waters, *State jurisdiction, Legislation.
Identifiers: Federal water rights, Agency bill, Desert Land Act.

If the claims of those supporting the federal view are sustained, and water originating on federal lands which constitute the major watersheds of the western states is owned and under the control of the federal government, then most of the so-called existing water rights and the water rights under state laws to appropriate and develop unappropriated waters will be subordinate to federal development and use of water. As long as there are legal questions as to water rights, such questions will result in costly litigation, and needed water development by local, state, and federal authorities will be unnecessarily burdened. If needed water development is to proceed there must be maximum cooperation between federal, state, and local water interest. There must be a clarification of states rights over federal rights; and the provision for existing water rights under state laws and protection of recognition of state law to develop water for beneficial use. (Gargola-Chicago)

ALLIANCE FOR CONSERVATION OF NATURAL RESOURCES IN PINELLAS COUNTY V FUREN (APPEALING DECISION OF NAVIGATION AUTHORITY ALLOWING FILL OF PORTION OF BAY).

110 So 2d 55-68 (1959) 14 p.

Descriptors: Judicial decisions, *Florida, Conservation, *Administrative agencies, Natural resources, Navigation, Water control, Bays, *Landfills, Bulkheads.

This case is in the district court on appeal from a decision of the circuit court affirming the issuance of a permit by the County Water and Navigation Control Authority for the fill of a portion of Boca Ciega Bay in Pinellas County. The district court affirmed on the same ground, i.e. that the authority was given wide discretion in the issuance of permits and if there is substantial evidence to support the decision it will not be changed. The authority's discretion will not be limited unless there is an abuse of this discretion. There was substantial evidence to support the findings of the county water and navigation control authority with respect to the beneficial effect of issuing the permit to fill a portion of the bay. (Watson-Fla)

CULLEY V PEARL RIVER INDUS COMM'N (CONSTITUTIONALITY OF CONSTRUCTION OF LARGE DAM AND RESERVOIR).
108 So 2d 390-409 (Miss 1959). 20 p.

Descriptors: Judicial decisions, *Mississippi, *Reservoirs, Watersheds (Basins), *Dams, Rivers, Water supply, Water districts, Riparian land, Condemnation, Eminent domain, Recreation facilities, Legislation, Navigable waters, Tidal waters.
Identifiers: Constitutional law.

Some residents of the area affected brought suit to declare the act creating the Pearl River Valley Water Supply District unconstitutional. The purpose of the act was the construction of a large dam and reservoir covering lands in parts of 5 counties. The Supreme Court of Miss upheld the act. The court stated that because the chancery court was empowered to determine if the project was feasible and would meet a public need, the act was not unconstitutional as conferring on the judiciary authority to decide legislative questions. Also the act did not violate constitutional prohibition against the legislature's passage of local, private, or special laws. Constitutional provision prohibiting the legislature from authorizing permanent obstruction of any navigable waters of the state must be construed in accordance with the meaning of the phrase 'navigable waters' at the time the constitution was adopted. It was then well established that a river was navigable in the technical sense as high up from its mouth as the tide flowed. Statutory definition of navigable waters does not effect the meaning in the constitution, and what constitutes navigable waters is a question of local and not federal law. (Watson-Fla)

DUVAL V THOMAS (RIGHT TO REASONABLE USE OF LAKE SURFACE).

107 So 2d 148-153 (2 DCA Fla 1968).

Descriptors: *Ownership of beds, *Riparian rights, Riparian land, *Water rights, Water utilization, Non-navigable waters, Lakes, Recreation, Reasonable use, Remedies, Landfills, Water law, Legal aspects, Boundaries (Property), Beds, *Florida.

The plaintiff and the two defendants owned property adjacent to and partially covered by a small lake. Defendant A filled a portion of the lake covering his property and defendant B erected a fence in the lake along his property line. These actions effectively cut off the plaintiff's ingress and egress to the main body of the lake. The question presented is whether the owner of a portion of the bed of a non-navigable land locked lake has the right to exercise

exclusive dominion and control over that portion of the bed and the waters of the lake which he owns. The court decided that the landowner only has the right to make reasonable use of the land and water and when ones lawful use is unreasonably interfered with, the owner of riparian rights has the remedy of injunction. The defendant's use was held to be an unreasonable interference in this instance and the plaintiff was entitled to an injunction to protect his riparian rights. (Horner-Fla)

JONES V UNITED STATES (RUNOFF DAMAGE).
175 F Supp 182-184 (Ct Cl 1959).

Descriptors: Judicial decisions, United States, *Alleviation of flow, Overflow, Flood damage, Embankments, Culverts, Drainage, Erosion, Topsoil, Surface water, Streams, Rivers, Runoff, Rainfall, *Mississippi.

Plaintiff alleges that the construction of a road on a 6 foot embankment and the installation of culverts beneath this embankment diverted the natural flow of the surface water and resulted in the inundation and erosion damage to his cultivated field. Although plaintiff was unable to prove that the culvert location changed the course or increased the natural drainage, it was shown that the use of culverts concentrated the surface water so that it emptied onto plaintiff's land at one point rather than many. This resulted in a discharge of water at a higher velocity than before and caused the erosion of topsoil and the water to stand at a greater depth. Judgment was for the plaintiff. (Childs-Fla)

LEATHERSICH V NEW YORK STATE WATER RESOURCES COMM'N (ADMINISTRATIVE DECISIONS).
293 NYS 2d 787-791 (Sup Ct 1968).

Descriptors: *New York, *Administrative agencies, Legislation, Ownership of beds, *Land fills, Recreation, Fishing, Lakes, Riparian land, Water law, Legal aspects, Administrative decisions.
Identifiers: Evidence.

The petitioner, representing a sportsmens association sought to reverse the decision of the water resources commission allowing landowner to fill a portion of a lake bed. The petitioner contended that the decisions of the commission made pursuant to a hearing must be supported by substantial evidence. The court upheld the commission's decision because it was not arbitrary or capricious and substantial evidence was not necessary. (Horner-Fla)

CROLEY V DE WITT (OBSTRUCTION OF DRAIN).

431 S W 2d 657-660 (Ct App Mo 1968).

Descriptors: *Artificial watercourses, *Watercourses (Legal), *Drains, *Obstruction to flow, Natural flow doctrine, Repulsion (Legal aspects), Dams, Floods, Flooding, Riparian rights, Channels, Water law, Legal aspects.

The defendant blocked an artificial channel which caused the plaintiff's land to be flooded. The Plaintiff sought to restrain the defendants' blocking of the drain. The defendant contended that since the drain was artificial it could be blocked under the common enemy doctrine. The court rejected the doctrine and held that the defendant could not obstruct the drain, whether natural or artificial, to the plaintiff's detriment. (Horner-Fla)

FARNES V LANE (EASEMENT TO LAKE).
161 N W 2d 297-301 (Minn 1968).

Descriptors: *Easements, *Riparian rights, Riparian land, Real property, Right-of-way, Lake shores, Lakes, Land use, Land tenure, Docks, Piers, Water law, Legal aspects, *Minnesota.

The defendants had a right of way easement across the plaintiff's lakeshore property. The plaintiff sought a declaration that the easement was for access to the lake only and that the defendant could not build a dock or store personal property on the easement area. The court held that the plaintiff had the burden of proving the use of the easement to be improper. Riparian rights are incident to an estate in land and an easement is not an estate so riparian rights are not necessarily inherent in an easement. The case was remanded to the trial court for a determination of whether the grantor of the casement intended to give riparian rights. (Horner-Fla)

PLAN FOR FLOOD DAMAGE AT BRISTOL, TENNESSEE-VIRGINIA,
Flood Study Committee, Bristol, Tennessee, Bristol, Virginia.
Clarence B. Kearfott, Jr., Maurice Conn, and Richard C. Horner, Jr.
1962, 4 tab, 9 plates.

Descriptors: *Flood plain management, Channel improvement, Flood damage, Flood plain zoning, Non-structural alternatives, Levees, Flood protection, Historic flood, Maximum probable flood, *Detention reservoirs, *Local governments, Project purposes, Land use, Regional floods.
Identifiers: Bristol (Tennessee), Bristol (Virginia), Mumford Creek, Beaver Creek.

Outlined is a possible flood control program for Bristol, Tennessee-Virginia. A review of past flooding, with reference to magnitude and frequency is given. Evacuation of the flood plain, levees, creek diversion, and diversion tunnels are considered as possible alternatives but rejected for various reasons. The conclusion and recommendations suggest construction of two detention reservoirs and channel enlargement. Other aspects of flood management are also considered. Relation of urban renewal projects to the overall flood damage prevention program is considered and particular possibilities listed. Criteria for regulations for flood plain zoning are discussed and a model ordinance presented. An extensive discussion of possible flood proofing alternatives is put forth and recommendations for assistance to individual property owners given. The proposed reservoir project is analyzed, and the cost-benefit ratio shown to be favorable. (Gargola-Chicago)

A SYSTEM FOR MEASURING CONDUCTIVITY, ACIDITY, AND RATE OF WATER FLOW IN A FOREST SOIL,
Washington Univ., Seattle.
Dale W. Cole.
Water Resources Res, Vol 4, No 5, pp 1127-1136, Oct 1968. 10 p, 10 fig, 13 ref.

Descriptors: *Network design, *Data processing, *Lysimeters, *Hydrologic data, *Soil water, Soil chemistry, Soil water movement, Computers, Washington.
Identifiers: Seattle (Washington), Tension lysimeters.

A system for collecting, recording, and analyzing forest soil water movement and quality data is described. The system is in operation on a lower terrace of the Cedar River watershed of the City of Seattle water supply. Tension lysimeters, consisting of fused aluminum oxide disks 11 in. in diameter are installed so that overlying soil and root systems are not disturbed. The collected water passes through flow cells which measure conductivity, acidity, and flow rate. The flow rate cell is sensitive to rates as low as 0.002 cm/hr. The collected data are automatically punched on paper tape and converted to tabular and graphic form in a computer. Examples of the system's output are presented. A flow diagram of the computer program is included. The data collected are particularly useful in studying ionic transport in soil to aid in understanding soil development, mineral-plant relationships, and land management practices. (Knapp-USGS)

THE STEADY-STATE MEASUREMENT OF THE RELATION BETWEEN HYDRAULIC CONDUCTIVITY AND MOISTURE CONTENT IN SOILS,
Sydney Univ., N. S. W., Australia.
D. E. Smiles, and G. D. Towner.
Water Resources Res, Vol 4, No 5, pp 1029-1030, Oct 1968. 2 p, 3 ref.

Descriptors: *Soil moisture, *Hydraulic conductivity, *Mathematical studies, Darcys law.
Identifiers: Soil moisture-hydraulic conductivity relationships.

A simple mathematical method is proposed to use with steady state head measurements to determine the relation between soil hydraulic conductivity and soil moisture content. The use of finite difference approximations to the Darcy flow equation is not necessary. The method requires the performance of a series of steady state infiltration experiments with different values of fluid flow rate and potential gradients. The simple experimental procedures to eliminate membrane impedance is suggested. (Knapp-USGS)

TEMPORARY FLOW MEASUREMENT IN SEWERS AND DRAINS,
M. H. Diskin.
ASCE Proc, J of Hydr Div, Vol 89, No HY4, Part 1, July 1963.

Descriptors: *Flow measurement, *Sewers, *Discharge measurement, Instrumentation.

Temporary flow measurement in circular channels, such as sewers and drains, as well as in sewers of other cross sections, can be carried out by introducing into the flow a pier-shaped element with a bottom rounded to fit the circular invert of the channel. The reduction in the area of flow causes a critical section to develop in the throat so formed, which gives a functional relationship between the discharge and the critical depth at the throat and also between the discharge and the depth at an upstream section adopted as a measuring section. The device is, in effect, a critical depth flume, or a Venturi flume, with an irregularly shaped throat composed of 2 openings on either side of the element introduced. Applying the theory of critical depth flumes, equations are derived relating the discharge to depth at the measuring section; the equations are solved numerically, making use of standard tables of properties of parts of a circle. The results of experiments performed on the proposed measuring device indicate fairly close agreement between the measured and the calculated rates of flow, most values of the coefficient of discharge falling in the range of 0.90 to 1.00. The experiments included tests on 4 measuring devices, 2 in each of 2 circular channels 10 in. and 16 in. diameter.

A FIELD METHOD OF MEASURING AND RECORDING FLOW IN SEWERS,
Warren Ellis, and C. Thorne Johnston.
Pub Works, Vol 94, June 1963.

Descriptors: *Sewers, *Flow measurement, Manholes, *Velocity, Roughness (Hydraulic), *Instrumentation.

A method of measuring and recording flow in sewers is given as follows. Determine the size, length, and slope of a sewer between 2 manholes. For known depths of flow in this sewer determine velocities between the upper and lower manholes by using dye test and stop watch. From the velocity data determine roughness coefficient 'n' through the Manning formula. Prepare a depth-discharge curve for the particular stretch of sewer. Using a stage recorder, continuously record the depth of flow in the sewer for desired period, and convert the depth data to flow rate. A portable, spring-wound stage recorder is used. A special ring to hold a bubbler tube with the tube opening at the sewer invert is mounted inside the sewer. Nitrogen gas from a bottle is bubbled through the tube, and the gas pressure required to discharge the gas beneath the liquid is recorded as depth of flow on the recorder chart. The special equipment used is described and illustrated. Costs of equipment are listed.

S. I. Solomon, J. P. Denouvilliez, and E. J. Chart.
Water Resources Res, Vol 4, No 5, pp 919-929, Oct 1968. 11 p, 5 fig, 2 tab, 5 ref.

Descriptors: *Data processing, *Digital computers, *Networks, Data storage and retrieval, Data transmission, Meteorological data, Hydrologic data, Synoptic analysis.
Identifiers: *Drainage basin characteristics, Newfoundland, Square grid data matrices.

Water resource studies in recent years have had a tendency to encompass larger areas. The increase in size and sophistication of these studies makes the use of computers very desirable to save time and increase accuracy. The study area must be converted to a schematic representation which is easily manageable by computers. A simple way of doing this is to cover the study area with a square grid, which may then be treated as a matrix of squares. This system can be used to store, process, and retrieve information in the fields of hydrology, hydraulic power, and economics. The application of the square grid system to the estimation of the precipitation, temperature, and runoff distribution in a large area is demonstrated. Use of the system enables efficient combination of the meteorologic and hydrologic information available in studying the precipitation, temperature and runoff distribution. An example of such a computation for a 43,000-square-mile area is given and the advantages of the method over the usual techniques are discussed. (Knapp-USGS)

UNIFORM FLOOD-FREQUENCY ESTIMATING METHODS FOR FEDERAL AGENCIES,
U S Geological Survey, Washington, D. C.
Manuel A. Benson.
Water Resources Res, Vol 4, No 5, pp 891-908, Oct 1968. 18 p, 1 fig, 6 tab, 5 ref.

Descriptors: *Floods, *Statistical methods, *Frequency analysis, Data processing, Flood protection, Rivers.
Identifiers: *Flood frequencies, Flood-plain management, Log-Pearson Type III method.

Large-scale planning for improved flood-plain management and expanding water-resources development makes increasingly important a consistent approach to estimation of flood frequencies. The most commonly used methods of flood-frequency analysis were studied and the results of applying these methods to a selected group of long-record representative sites in different parts of the country were compared. It is recommended that all government agencies adopt a uniform procedure for flood-frequency analysis at sites where records are available. The log-Pearson Type III distribution was selected as the basic method, with provisions for departures if justified. Further study leading toward improvement or revision of methods is recommended. GEOPHYSICAL LOG CROSS-SECTION NETWORK OF THE CRETACEOUS SEDIMENTS OF SOUTHERN MARYLAND,
U. S. Geol Surv., Washington, D. C., Water Resources Div.
Harry J. Hansen, III.
Maryland Geol Surv Rep of Invest No 7, 46 p, 1968. Test, 8 fig, 17 plate, 7 tab, 1 append, 67 ref.

Descriptors: *Stratigraphy, *Hydrogeology, *Electrical well logging, *Radioactive well logging, *Cross-sections, Geologic formations, Palynology, Sampling, Maryland.
Identifiers: Southern Maryland, Stratigraphy, Holes.

Cross sections and maps were prepared, using electric logs, gamma-ray logs, and published stratigraphic data for groundwater oriented studies in Southern Maryland. The correlation network consists of 4 cross sections subparallel to the strike of the Cretaceous formations and 12 cross sections subparallel to the dip. Correlation is based on geophysical (electric and gamma ray logs) and lithological data; selected well samples were studied palynologically. This network suggests that groups of sands, such as those comprising the Patuxent Formation, can be correlated along strike in the Anne Arundel-Prince Georges County area for distances exceeding 20 miles. This is not compatible with a concept of individually isolated, channel or 'shoestring' sands. Sand counts indicate that both the Patuxent and the Raritan-Patapsco Formation (undivided) exhibit a southerly decrease in sand percentage. In the Anne Arundel-northern Prince Georges County area these formations contain greater than 45% sand; in Charles County sand percentages characteristically are less than 30%. The mottled clays associated with these sediments change form predominantly red-brown in the north to predominantly gray-green in the south. (Knapp-USGS)

Nova Scotia Department of Mines, Halifax, and U. S. Geological Survey.
George F. Pinder, and J. D. Bredehoeft.
Water Resources Res, Vol 4, No 5, pp 1069-1093, Oct 1968. 25 p, 18 fig, 53 ref.

Descriptors: *Computer models, *Digital computers, *Computer programs, *Unsteady flow, *Aquifers, Aquicludes, Analog models, Pump testing, Aquifers characteristics, Hydrogeology, Water levels.
Identifiers: Finite difference method, Pumping tests.

A digital computer program was written to solve linear, parabolic, partial differential equations of unsteady state flow in confined aquifers by an implicit finite difference technique. The program was checked by calculating solutions for problems described by known analytical functions and solved by electrical analog. The calculated and analytical values compared favorably. An aquifer at Musquodoboit Harbour, Nova Scotia was analyzed; aquifer parameters in the digital model were modified to fit computed results to pump-test data. The results were compared to an electric analog solution and the results were in good agreement. (Knapp-USGS)

RAINSTORMS MADE TO ORDER,
L. Arthur Hoyt.
Pub Works, Vol 99, No 3, pp 95-98, March 1968. 4 p, 1 fig, 2 photo.

Descriptors: *Computer programs, *Storms, *Rainfall intensity, Watersheds, *Storm runoff.

A computer controlled rainfall simulator has been developed by Ven Te Chow of the University of Illinois to produce artificial rainstorms. The simulator can develop storms of any intensity pattern, repeat them at any interval desired over all types of terrain, and measure runoff from the terrain with given conditions of absorption and other parameters, to an accuracy never before obtainable. The rainfall can be released over any part, or all, of a 40- by 40-ft artificial terrain. Types of storms are programmed and stored on computer tape so they can be started, stopped, or repeated at will. The terrain simulated can range from lush water basin areas to arid desert. Water runoff is accurately measured. Major objective of the entire study is to

investigate basic laws of flow mechanics of surface water over artificial watersheds. Descriptions of the electronic simulator and operation of major components are given.

LINEAR ANALYSIS OF RAINFALL-RUNOFF RELATIONSHIP,
V. C. Kulandaiswamy.
Instn Engrs (India)-J, Vol 46, No 11, pt Ci 6, pp 594-603, July 1966.

Descriptors: *Rainfall-runoff relationships, *Hydrographs.
Identifiers: *Calculations.

Study of relationship between rainfall excess and surface runoff by treating rainfall excess as 'inflow to' and surface runoff as 'outflow from' basin, and assuming relationship to be linear; using Laplace transform method, expression is derived for instantaneous unit hydrograph; various assumptions underlying existing instantaneous unit hydrograph theories and approximations made in their development are explained.
W69-01924

A BASIC STUDY OF THE RAINFALL EXCESS-SURFACE RUN-OFF RELATIONSHIP IN A BASIN SYSTEM,
V. C. Kulandaiswamy.
Thesis, Univ of Illinois, 1964.

Descriptors: *Rainfall-runoff relationships, *Hydrographs, Drainage, Storms, *Surface runoff.
Identifiers: *Calculations.

After reviewing various instantaneous unit hydrograph theories, the author develops a general theory for the relation between rainfall and run-off in a drainage basin. An equation is first derived for storage in the basin, and this equation is then combined with the equation of continuity to give the differential equation for the system. The theory is valid for both linear and non-linear cases. Storms over 6 natural basins were analysed to verify the theory; the storage and surface run-off computed agreed well with observed values.

SKIPTON-SILSDEN SEWERAGE FINISHED AHEAD OF SCHEDULE.

Munic Eng, Lond, Vol 140, p 1344, 1963.

Descriptors: *Storm runoff, *Overflow, Sedimentation, Weirs.
Identifiers: Storage tanks.

In a recently completed joint sewerage scheme for Skipton rural district and Silsden urban district, Yorks., all the sewage from the area will be conveyed to the Keighley disposal works by an extension of the Keighley sewers up the Aire valley. Six small sewage works will be abandoned, but at Silsden and Stelton storm water will overflow to sedimentation tanks at the old works before discharge to the river Aire. There are also five overflow weirs on existing sewers with direct discharges to the nearest watercourse. A pumping station on the site of the Kildwick works will pump sewage from Farnhill and Kildwick across the river Aire by a rising main to join the main sewer.

NEWTHORPE, NOTTS., SEWAGE DISPOSAL WORKS.

Survr Munic Cty Engr, Vol 130, No 3923, pp 18-19, 55, 1967.

Descriptors: *Storm runoff, Overflow.
Identifiers: *Storage tanks.

A description, with a flow diagram of treatment facilities and a map of the sewerage area involved, is given of new works to be constructed jointly by Basford R.D.C. and Eastwood U.D.C., Notts. A new sewage works at Newthorpe, designed to treat a flow of 18 m.g.d. by biological filtration with recirculation of effluent, will replace 7 existing works; flows in excess of 18 m.g.d. will pass to 3 storm-water tanks. Primary sludge will be treated by Paxman sludge concentrator units, and humus sludge will be returned to the main inlet.

W69-01692

DESIGN OF UNDERWATER STORM WATER OVERFLOW STORAGE SYSTEM,
J. S. Blossom.
Piping and Air Condit, Vol 40, No 4, pp 126-30, April 1968.

Descriptors: *Design, *Storm runoff, *Overflow, Runoff, Outlets, *Flow measurement, *Instrumentation.
Identifiers: *Storage tanks, *Combined sewers, *Interceptor sewers, *Suspended solids, *Capacity.

Sequence of operation of underwater storm water overflow storage system using flexible tanks is described; combined sewer carries runoff from drainage area; dry weather flow connection carries normal sanitary flow to interceptor, and overflow sewer carries storm water to river outfall; diversion structure of sewer diverts flow to storage system; incorporated in structure is flume to measure flow; suspended solids analysis of overflow; capacity analysis of underwater storm water overflow storage system, based on 11 yr of rainfall data.

DRAW-DOWN AND OTHER FACTORS RELATING TO DESIGN OF STORM-WATER OVERFLOWS ON SEWERS,
C. D. C. Braine.
J Instn Civ Eng, Vol 28, No 6, pp 136-63, April 1947.

Descriptors: *Storm runoff, *Overflow, Sewers, *Siphons, *Stilling basins, *Drawdown, Design.

Calculations for critical depth and draw-down; description of storm water overflows of restricted flow; stilling pond and siphon types.
W69-01695

HYDRAULIC DESIGN OF DEPRESSED CURB-OPENING INLETS,
W. J. Bauer, and D. C. Woo.
Nat Res Council-Highway Res Bd-Res Rec, No 58, pp 61-80, 1964.

Descriptors: *Hydraulic design, *Intakes, *Highways, Drainage systems, *Storm runoff.

New hydraulic design curves for depressed curb-opening inlets used in highway drainage systems were developed from experimental data; curves cover considerable range of practical conditions and also allow direct comparison of effect of size of depression to efficiency of inlet; sump condition is included that refers to condition that inlet is located at low point of sag vertical curve; application of curves is presented.

DESIGN, CONSTRUCTION AND OPERATION OF SEWER OUTFALLS IN ESTUARINE AND TIDAL WATERS,
Frank L. Heaney.
Water Poll Control Fed J, Vol 32, No 6, pp 610-21, June 1960.

Descriptors: *Estuaries, Design, Construction, *Outlets, Sewers, Standards, Chlorination, *Rainfall intensity, *Overflow, *Water pollution, *Hydraulics, Maintenance.
Identifiers: *Combined sewers, *New York, N. Y., *Urban drainage.

The object of design of outfall sewers was to destroy the physical character of the sewage without objectionable odors, floating solids at shore line, scum accumulations or bottom deposits. Present day standards require, in addition, a reduction of bacterial concentration. In discussing design the author states that shore overflows from plant should be avoided and provisions should be made for emergency chlorination. In New York City experience has shown that 0.02 in/hr rainfall has resulted in discharge of approximately 30% raw sewage from combined sewer overflows. Also that from 70 years of records, one to two rainstorms of over 0.02 inch/hour occur each week during the summer. The receiving waters remain polluted for a period of one to three days after each rainfall. Author discusses location of outfalls, hydraulic considerations, and design of outlet structures. In design the author uses the charts and formulas of Rown and Palmer and shows the theoretical computations of mixing of sewage with sea water. Each area must have tests taken to assess the effectiveness of mixing. The author discusses construction and maintenance of outfall sewers and also costs of same.

STORM WATER TANKS WITHOUT GRADIENTS, A METHOD OF IMPROVING THE SEWERAGE SYSTEMS OF TOWNS,
F. Schimrick.
Gas Wasserfach, Vol 92, pp 156-8, 1951.

Descriptors: *Storm runoff, Design, Pumping.
Identifiers: *Storage tanks, *Urban drainage.

The author discusses the possibility of inserting storm water tanks in sewerage systems. Where the depth of the tank is somewhat less than the internal diameter of the inlet channel, no gradient is necessary. The use of such inserted tanks to reduce the load on pumping plant and sewage works is discussed with examples of their effect in various towns.

DEEP TUNNEL SYSTEM GETS OFF THE GROUND.

ASCE - San Eng Div, Newsletter, pp 7-8, May 1967.

Descriptors: *Tunnels, *Grants, *Sewage lagoons, *Floor control, Instrumentation, *Overflow, Pumping, *Sewage sludge.
Identifiers: *Combined sewers, Chicago (Ill.), *Storage tanks, New York (N. Y.).

Chicago has received a $1 million grant from FWPCA to help build and demonstrate a $14,389,600 deep-tunnel system to store the rain-swollen flows in combined sewers in part of the city's northside. When the flow in the combined sewers returns to normal, the water stored in the tunnel will be pumped back into the sewer lines for treatment. Other grants awarded were to: Shelbyville, Ill. to help build a system to hold and treat combined-sewer flows in several holding and treatment lagoons and a holding tank; to New York City to help pay for the installation and evaluation of a siphon-type Ponsar regulator designed to provide better control of the flows from combined sewers into interceptor sewers; and to Columbus, Ohio to help renovate and improve the efficiency of the combined-sewer overflow holding tanks by installing new pumps which will remove sludge which now accumulates and causes odors.

ASCE SEWER PROJECT CONTINUES.

ASCE - San Eng Div, Newsletter, p 5, Jan 1967.

Descriptors: *Pumping, *Equipment, Drainage system.
Identifiers: *Sewer-within-sewer, *Combined sewers, *Urban drainage.

ASCE is continuing to study the sewer-within-a-sewer concept under a new contract. Combination grinder-pump units will be developed for both household and commercial uses. A limited number of these will go into buildings in a demonstration area and be connected to piping installed in existing combined sewers. Tests will be conducted for a six month period. At the same time, plans will be developed for a demonstration in an entire urban drainage area.
W69-01713

COMBINATION SEWER SEPARATED INTO SANITARY AND STORM LINES LOW COST.

Civ Eng, Vol 36, No 5, p 55, May 1966.

Descriptors: Sewers, Pipes, Tunnels.
Identifiers: *Combined sewers, Storm sewers.

Sewer department of Minneapolis, Minn., has recently placed 5700 ft of corrugated steel pipe in bottom of existing combination sewer--for sewage only, to reduce load on treatment plant; Armco Smooth-Flo pipe, 42 in. in diam has asphaltic liner; flattened to 53 x 22.5 in., it fits well into bottom of old 102-in.-diam tunnel; prefabricated bands with neoprene gaskets hold sections together, and corrugated hold-down bands anchor them to tunnel wall; concrete is then placed to prevent line from 'floating' and provide smooth base for storm flow above.
W69-01714

DATA AVAILABLE ON SEPARATING COMBINED SEWERS.

Environ Sci Technol, Vol 2, No 8, p 577, Aug 1968.

Descriptors: *Construction costs, *Overflow, *Storm runoff, Pumping.
Identifiers: *Combined sewers, *Sewer separation, *Storm sewers, *Storage tanks, *Washington, D. C.

The cost of separating the combined storm and sanitary sewers in the United States, which now serve 36 million people, is approximately $48 billion, according to a recent report prepared by the American Public Works Association for the Federal Water Pollution Control Administration. The report is a national inventory of the effects and means of correcting combined sewer overflows and separate storm and sanitary sewer discharges in the United States. A pilot project to construct two giant rubberized tanks in the Anacostia River in Washington, D. C. to store overflow during heavy rainfall is also mentioned. Each tank has a capacity of 100,000 gallons and will be anchored in the river bed. During the period of overflow, sewage will be diverted into an on-shore pump house where it will be crushed before being pumped into the tanks. The contents of the tanks will be pumped back into the sewer lines after the storm water recedes.

SEWER SEPARATION.

Water and Wastes Eng, Vol 3, p 2, 1966.

Descriptors: Sewers, *Overflows, Design, *Water pollution.
Identifiers: *Combined sewers, *Sewer infiltration.

Engineers and Superintendents of Sewer systems representing a cross-section of the country were asked several questions regarding their systems. These questions included miles of different-types of sewers, if infiltration was a problem, number and types of regulators and diversions used, design of combined systems and if any bottlenecks, and an estimate of percentage and amount of pollution bypassed each year. Answers indicated that infiltration was a problem in several cities, but the sewage lost from bypassing or overflows was not a significant pollution problem.
W69-01719

SEWER WITHIN A SEWER.

Water Works and Wastes Eng, Vol 1, pp 36-37, 101, Feb 1964.

Descriptors: *Sewers, *Plastic pipes, *Construction, Construction costs.
Identifiers: *Combined sewers, *Ottawa (Canada).

Ottawa, Ont., Can., constructed small gravity sewers inside 2 existing large-diameter combined outfall sewers to convey intercepted sanitary flow to a new main interceptor tunnel. The inner sewer slopes in the opposite direction from the outer sewer, which is accomplished by starting the high end of the inner sewer at the top of the large sewer and spiraling it down the outer sewer wall. In one location because of corrosive wastes the inner sewer consists of 1440 ft. of 15 in. dia. PVC plastic pipe. In the other location the inner sewer is 1303 ft. of 12 in. CI pipe. The 15 in. sewer cost $20.41 to $24.41 per ft in place. The sewer within a sewer technique permitted main interceptor modifications that saved an estimated $1,200,000. When completed, the main interceptor system will consist of 38,300 ft of 72 in. to 96 in. dia. tunnel.

FACTS ABOUT COMBINED SEWER SYSTEMS.

Water and Wastes Eng, Vol 4, No 11, p 78, Nov 1967.

Descriptors: *Combined sewers.

Facts about combined sewer systems are being collected by the American Public Works Association. A $250,000 grant from the Federal Water Pollution Control Administration has been awarded to the Association, whose representatives will conduct on-site interviews with water officials of about 900 communities with combined sewer systems. All cities with populations over 25,000 will be included in the survey and checks will also be made on 30 percent of smaller communities having this type of system.

DRAINAGE (SEWERAGE).
C E Code of Practice No 5, Instn of Mun Engrs, London, 1950.

Descriptors: *Design, *Sewers, Manholes, *Storm runoff, *Overflow, Siphons, Pumping, *Runoff.

In a Code of Practice intended to indicate what is considered to be good practice in the design and construction of sewerage systems under average conditions, recommendations are made concerning choice of sewerage system, layout, size, shape, depth and gradient of sewers, manholes, storm-water overflows, siphons, pumping stations, pumping mains, tidal outfalls, and other works. Information is given on legislation concerning discharge of trade waste waters to sewers and on the effect of some types of trade waste waters on sewerage systems and on natural waters. In an appendix, a suggested method for calculating run-off is described.

INTERCEPTOR SEWERS,
E. E. Bloss.
Presented at Amer Soc of Civ Engrs Meeting, Oct 18-22, 1965, Kansas City, Missouri.

Descriptors: Design, Pumping, Treatment, *Flow measurement, Hydrographs, Overflow, Storm runoff, *Water pollution control, Hydraulics, Construction costs.
Identifiers: *Interceptor sewers, *Capacity, St. Louis (Mo.), Combined sewers, Sewer infiltration.

Subject matter discussed in this paper on interceptor sewers applies specifically to the design of the interceptor sewers of the Metropolitan St. Louis Sewer District Pollution Abatement Project. The paper includes as background information, a brief description of the District, as well as a brief description of the overall plan of the proposed interception, pumping and treatment facilities. The methods used in gaging present flows are also discussed and a number of measured sewer hydrographs are reproduced. Detailed investigation of the spill of mixed sewage and rainfall with interceptors of several different capacities is discussed in considerable detail leading to the finding that adequate abatement of pollution can be achieved with interceptors having a capacity equal to the peak rate of sewage flow. In this investigation sewage flow was considered to consist of domestic and industrial waste flow only; it did not include ground water infiltration. However, to completely avoid spill during dry weather, it was further concluded that interceptors, in final design, should have a capacity equal to the peak flow of sanitary sewage plus the peak rate of ground water infiltration. Detailed computations of sewage spill were made under conditions of present and assumed ultimate watershed development for interceptors on two of the largest sewers of the District as finally designed. Two typical interceptor structures are discussed and illustrated. Storm water flows for several assumed runoff rates and the effects of such flows on the hydraulics of the trunk interceptor sewer are discussed. Finally, in order to illustrate the disproportionate effect on cost when compared to the small improvement in pollution abatement accomplished by increasing interceptor capacities. The trunk sewer was resized to accommodate 1.25 times peak dry weather flow. A cost estimate of the trunk to carry the larger flow was prepared and compared with the estimated cost of the trunk as designed. The reduction in degree of pollution abatement which would have been achieved by the slightly larger interceptor was also computed and shown to be inconsequential. The economic inadvisability of increasing interceptor capacity beyond one times peak dry weather flow for the St. L

CALCULATION OF STORM-SEWAGE TANKS.
H. Fischer.
Gas Wasserfach, Vol 105, pp 543-544, 1964.

Descriptors: *Storm runoff, Design, Overflow, Discharge (Water).
Identifiers: *Storage tanks, *Calculation, *Capacity.

In connexion with the design of storm-sewage tanks for the Rheingonheim area of Ludwigshafen, investigations were carried out on the frequency of action of storm-sewage overflows, and the characteristics which should be considered when calculating the discharge after the peak load. Results showed that the characteristics of the flow record can be very variable for different periods of rain even if the maximum coefficient remains the same. The author presents graphs and a chart for a simplified calculation of discharge from storm-sewage overflows and gives a numerical example which can be adapted to any particular characteristic of discharge.

DESIGN AND OPERATION OF LOW-HEAD SELF-PRIMING SIPHONS,
C. D. C. Braine.
Survr, Vol 116, pp 1141-43, Nov 2, 1957.

Descriptors: Design, *Siphons, *Weirs, *Storm runoff, *Overflow, Sewers, Discharge (Water).

Small self-priming siphons have advantages over weirs for storm water overflows and other water level regulating uses in sewers and canals. They are as a rule cheaper than weirs provided that at least one foot of head is available. The siphon is more flexible in operation than a weir. Siphons can be made very sensitive, and by admitting air in limited quantities, their discharge can be varied considerably. Also installations of a battery of several siphons permits flexibility of discharge. Nine illustrations of siphon designs are given. Self-priming of a siphon is achieved by allowing a sheet of water to flow over the whole width of the crest so that as the sheet falls it strikes the opposite wall of the siphon. The falling sheet of water entrains air with it and carries it down to the outlet so that the siphon very quickly primes. A formula for estimating the discharge of circular siphons flowing full is given.

FLUID FLOW MEASUREMENT.

Brit Patent 862,891.

Descriptors: *Flow measurement, *Pipes, *Tracers, Velocity.

A method is claimed for determining rates of fluid flow and comparing relative rates of flow under different conditions in pipes, canals, or rivers, by introducing a known quantity of radioactive material and monitoring the stream to obtain a time-integral value of the effect of the radioactivity during its passage or transit past a given point (by integrating the response of a radioactivity detector such as a Geiger counter). The method is based on the discovery that the integral or total number of gamma or other suitable radioactive rays detected is inversely proportional to the velocity of flow, but is independent of the way in which the radioactivity is spread out along a segment of the fluid stream as the result of flow conditions.
W69-01658

PROGRESS REPORT OF THE STORM DRAINAGE RESEARCH PROJECT.
Johns Hopkins Univ., Baltimore, Md. Dept. Sanit. Eng. and Water Resources.

Report No 10: July 1, 1961 to June 30, 1962 Baltimore, June 1962, 187 pp.

Descriptors: *Instrument, *Storm runoff, Rain gages, *Flow measurement, *Weirs.
Identifiers: *Storm sewers, Surface permeability.

The results of the project's effort to develop reliable rainfall and stormwater runoff measuring instruments are presented. A depth type pressure sensing device for measuring the flow at a single point in a storm sewer, and a sharp-crested sensing weir for measuring the runoff entering a stormwater inlet, have been developed. It is felt that these instruments can be employed by other agencies with very few changes. The observation of widely differing amounts of runoff from storms of the same frequency, with changes in soil permeability as a factor, is one of the other problem areas mentioned.

THEORETICAL CONSIDERATION OF SIDE WEIRS AS STORM WATER OVERFLOWS,
P. Ackers.
Instn Civ Engrs Proc, London, Vol 6, pp 250-69, Discussion pp 328-43, Feb 1957.

Descriptors: *Overflow, *Weirs, *Storm runoff, Spillways, Discharge (Water), *Velocity.

Combining Bernoullis theorem and weir discharge formula, equation for water profile at side spillway can be derived, making allowance for variation in channel velocity; weir coefficient, velocity variation and extent of draw down are considered in relation to G.S. Coleman and D. Smith's results and simplified design formula are given; insertion of dip plates may reduce discharge if clearances are small.
W69-01677

THE HYDRAULIC RESISTANCE OF DRAINAGE CONDUITS,
P. Ackers.
Proc Instn Civ Engrs, Vol 19, 1961.

Descriptors: Sewers, *Flow resistance, *Roughness (Hydraulic), *Velocity, *Storm drains, Pipes.
Identifiers: *Storm sewers.

Further details are given of theoretical and experimental studies on the hydraulic resistance of sewers and storm drains, which have been carried out by the Hydraulics Research Station (see Wat. Pollut. Abstr., 1963, 36, Abstr. No. 1823) including experiments on salt-glazed, spun concrete and pitch-fibre pipes, both full and partly-full. The results, given in tables and graphs, show that flow conditions in new sewers are turbulent-transitional and that the eccentricity and spacing of the joints affect the overall roughness. Neither the Crimp and Bruges nor the Manning formulae fit the experimental data and the equation proposed by Colebrook, C.F., and White, C.M., is preferred. On the basis of data obtained, roughness values for new sewers are suggested. Under partly-full conditions, proportional velocities follow the theoretical trend, but are lower, indicating an increase in roughness for free-surface flow, the possible cause of which is discussed.
W69-01698

TABLES FOR THE HYDRAULIC DESIGN OF STORM-DRAINS, SEWERS, AND PIPE-LINES,
P. Ackers.
Hydraul Res Pap No 4, H M Stationery Office, London, 1963.

Descriptors: *Hydraulic design, *Storm drains, *Sewers, *Velocity, *Roughness (Hydraulic), *Discharge (Water), Design, Pipes.
Identifiers: *Storm sewers.

To assist in the design of sewers and storm-water drains, this publication contains tabulated data on the discharges and velocities in pipes over a range of diameters (6-96 in.) hydraulic gradients (1 in 10,000 - 1 in 10), and roughnesses (k sub s values from 0.0002-0.05 ft.).

RAIN DISCHARGE AND SEWAGE SLUDGE,
G. Amberger.
Gesundheit-Ing, Vol 56, p 298, 1933.

Descriptors: *Storm runoff, *Sewers, *Design, Overflow.

When the sewage flow is so divided that half continues in the same direction, half through a pipe at an angle, then about 97% of the sludge goes through the latter pipe when the angle with the original direction is 30 degrees, about 87% when it is 120 degrees. These data are significant in the construction of plant by-passes to provide for heavy flow resulting from rains so that the richer sewage goes through the plant, the dil. being by-passed to the river.

FLOW CHARACTERISTICS OF PVC SEWER PIPE,
L. C. Neale, and R. E. Price.
ASCE Proc, J Sanit Eng Div, Vol 90, No SA3, Pt 1, paper 3955, pp 109-29, June 1964.

Descriptors: *Plastic pipes, *Sewers, *Sewer hydraulics, Velocity, Head loss, *Flow measurement.

Flow tests were run of 8 and 12-in. thin-wall, flexible PVC pipe designed for use as sewers; pressure and open channel flow characteristics were investigated and analyzed; velocity profiles were made; it is shown that temperature has significant effect that should be considered in critical or marginal designs; head losses for solvent cemented bell and spigot joint were measured, and coefficients of 0.0011 with bell pointed downstream and 0.0068 with bell pointed upstream were determined.
W69-01705

FLOW VELOCITIES IN SMALL SEWERS,
R. D. Pomeroy.
J Water Poll Control Fed, Vol 39, pp 1525-1548, 1967.

Descriptors: *Velocity, *Sewers, *Sewer hydraulics.
Identifiers: *Calculations.

Methods were developed for obtaining data on velocity and discharge in sewers for use in calculat-

ing the coefficients in hydraulic equation, and these techniques were used on 95 small sewers. The data obtained, together with published studies on experimental pipes, confirm the conditions of previous investigators that velocities in partly-filled pipes do not conform to the traditional equations. From the data obtained, equations were developed for velocities in partly-filled pipes of circular section. The experimental results also confirmed the accepted view that a velocity of 0.5-0.6 m per sec, or 1.6-2 ft per sec, is required to avoid excessive accumulations of debris. There was evidence of a retarding effect of critical-depth turbulence, but it is impracticable to avoid these effects in the smallest sewers. It was found that poor construction, including irregularities of slope, is often the cause of poor coefficients; the asbestos-cement sewers tested showed better coefficients than the vitrified-clay sewers, and the concrete sewers were poorest.
W69-01706

FLOW VELOCITY IN PARTLY FILLED PIPES,
Richard Pomeroy.
Water and Sewage Works, Vol 108, p 180, May 1961.

Descriptors: *Velocity, Flow measurement, *Pipes.
Identifiers: *Calculations.

It is important, for a variety of purposes in the sanitary engineering field, to be able to calculate velocity and flow conditions in sewers running less than full. The equation which has come to be known as Manning's is most commonly used for this purpose. This equation rests upon the classical assumption that velocity can be calculated as a function of R, S, and a friction coefficient. This basic assumption is an approximation when streams of different shape of cross section are considered. This following equation has been deduced for calculating velocity of flow in a partly filled pipe of circular cross section. V = k (Q exp. 0.29) (S exp. 0.38) (D exp. -0.13). This equation conforms to available data better than the Manning equation. The value of k is related to the Hazen-Williams coefficient by the equation k = 0.702 m C (0.71) in which m is approximately 1.10.
W69-01707

MEASUREMENT OF MANNING'S ROUGHNESS COEFFICIENT,
O. J. Schmidt.
Sewage Industr Wastes, Vol 31, p 995, 1959.

Descriptors: *Sewers, *Velocity, *Design, Construction, *Roughness (Hydraulic).
Identifiers: *Combined sewers, *Kansas City (Mo.), Urban drainage.

In connection with a master plan for trunk sewers and sewage-treatment facilities in Kansas City, Mo., a series of velocity measurements was made in a large trunk sewer carrying both sewage and storm water. The method used to measure mean velocity is described; it is considered to be as simple, accurate, and inexpensive as more conventional procedures. Variations in n in Manning's formula occur with changes in depth of flow in sewers and for certain sewer designs such variations can be important. The value of n can be changed from that used in the design of the sewer by a number of conditions brought about during construction or which can occur afterwards. Bottom deposits or other conditions which greatly alter the invert surfaces of the sewer probably caused a greater variation in n than that caused by changes in depth of flow. Some aspects on which further investigations are required, are indicated.
W69-01709

OPTIMUM DESIGN OF SEWERS,
A. A. Smith.
Civ Eng Publ Works Rev, Vol 60, p 206, 1965.

Descriptors: *Sewers, *Design.
Identifiers: Capacity, Calculations.

After a brief review of the general properties of partly full circular conduits as applied to sewer design, the author shows that the effect of shape is both significant and important in the design of sewers of adequate carrying capacity. The concept of optimal sewer diameter is developed, and the relevance of criteria of self-scouring and carrying capacity is considered. A design chart is given for the solution of problems of a general nature, with some practical examples of its use.

DRAINAGE (SEWERAGE).

J Inst of Sanit Engrs, Vol 50, pp 177-94, 1951.

Descriptors: *Storm runoff, *Overflow, Velocity, Sewers, Flow, *Runoff, Design.
Identifiers: *Lloyd-Davies formula.

In a discussion on the C.E. Code of Practice No. 5 (1950) 'Drainage (Sewerage)', subjects raised included velocity of flow in sewers, admission of trade waste waters to sewers, storm water overflows, and the Lloyd-Davies method of calculating run-off.
W69-01718

PRINCIPLES FOR CALCULATING FLOWS IN SEPARATE AND COMBINED SEWERS,
Waclaw Blaszczyk.
Gaz Woda Tech Sanit, Vol 26, No 1, p 24, 1952.

Descriptors: *Rainfall intensity, *Design, *Sewers, *Flow measurement.
Identifiers: *Combined sewers, Warsaw (Poland).

Following a review of the theory of calculating combined sewer flows by means of several expressions, the author presents time-intensity plots proposed by various authorities for Warsaw, in which intensities for a rainfall of 1/2 min. vary from 25 to 202 l. per second per hectar; for t = 1 min., i varies from 16 to 124; for t = 2 min., i varies from 12 to 70; and for t = 3 min., i varies from 9 to 58. In many projects, the results are based upon the experience of the designer as indicated by the data cited above. Accordingly, the author proposes that it is necessary to come to some agreement as to the coefficient of probability to be used for economical sewer design, and that it should not be necessary to depend wholly upon the judgment of the designer. Of course, the establishment of suitable norms must be based upon thorough and complete calculations and review of existing data. No one, according to the author, has dependable results, as practically none of the designers have had the opportunity of confirming their calculations in practice, because in many cases the system has not been completed as designed, the drainage area has not been fully settled, or the rains designed for have not occurred.

INFILTRATION INTO SEWERS.

N Z Eng, Vol 14, pp 233-238, 1959.

Descriptors: *Storm runoff, Sewers.
Identifiers: *Sewer infiltration.

In 1957 the Council of the New Zealand Institution of Engineers set up a committee to investigate into the excessive infiltration and entry of storm water into sanitary sewers. In the first report of the committee, the results of a questionnaire sent to various authorities are summarized, and conclusions drawn therefrom are studied. It appears that storm-water entry and/or infiltration is serious in 75 per cent of the systems studied. It is recommended that further investigation should be made into causes of infiltration and possible remedies, including the preparation of a code of good practice in the laying of sewers and drains.
W69-01732

EXFILTRATION TESTING OF LARGE SEWERS.

Public Works, p 108, Jan 1968.

Descriptors: *Sewers, Construction.
Identifiers: *Sewer infiltration, *Sewer exfiltration.

Infiltration and exfiltration methods for ground water leakage into sewers are compared. Tests were performed on sewer pipes rangin g from 27 to 72 in. Test results showed that exfiltration testing is a valuable tool in sewer construction.

EFFECTS OF USE ON THE HYDRAULIC RESISTANCE OF DRAINAGE CONDUITS,
P. Ackers, M. J. Crickmore, and D. W. Holmes.
Proc Instn civ Engrs, Vol 28, Pap No 6743, pp 339-359, 1964.

Descriptors: *Pipes, Drainage systems, Conduits, Roughness (Hydraulic), *Aging (Physical), Deterioration.
Identifiers: *Capacity.

As a sequel to studies on the hydraulic roughness of new sewer pipes (see Wat. Pollut. Abstr., 1963, 36, Abstr. No. 2021), field experiments were carried out to obtain information on the probable deterioration of capacity with age and use. The studies, in which both salt-velocity and radioactive-tracer techniques were used (the iodine-132 method being found most convenient for use in sewers), were carried out at 20 sites giving a wide range of pipe materials, sizes, gradients, and degrees of sliming; and roughness values were calculated using the Colebrook-White equation for turbulent flow. Slime became established in sewers after a relatively short period of use and tended to predominate near the normal water level, but the degree of sliming varied considerably at the different sites, probably depending on the composition of the sewage as well as the boundary shear. Layers of slime less than 1/8-inch thick had little effect on the resistance to flow or the capacity of the pipe, but above this level the resistance to flow increased rapidly with thickness of slime. Compared with slime, the presence of sediment in the invert had more marked effects on the roughness values particularly under conditions such that standing waves were produced. The effects of sediment varied widely depending on the 'bed form' (a function of particle size) and the flow conditions. Based on the experimental results, roughness values are recommended for mature foul sewers.
W69-01752

8C. Hydraulic Machinery

AUTOMATIC CONTROL VALVES,
R. H. Babcock.
Water Wastes Eng, Vol 5, No 1, pp 43-5, Jan 1968.

Descriptors: *Automatic control, *Flow control, *Instrumentation, Sewage treatment, Hydraulics.
Identifiers: *Calculations.

Many specialized valves are now incorporated in the automatic control of sanitary systems and successful application of a control valve to a process requires complete understanding of the hydraulics of the system under design. Design techniques for control problems involve flow of reagents (pH control), pipeline losses, inlet losses, outlet losses, and fitting losses. In every case a valve can be considered a control of simple flow between two reservoirs. A valve may also be considered a variable orifice. Derivations of sizing equations for (1) liquids, (2) gases and (3) steam and other vapors are given. A table presents typical valve coefficients for valve types such as butterfly, needle, and wide range V port. Some typical valve sizing problems are presented and solved by application of the equations derived.

BUILT TO BE SEEN,
Wilsey and Ham, San Mateo, Calif.
Daniel W. Klar.
Amer City, pp 96-97, May 1967.

Descriptors: *Pumping, *Storm runoff.

A pump station in Foster City, Calif. is described. The station serves a community with an expected population of 35,000 in 1977, and with an average elevation of 4.5 ft. above sea level. The station has a system of levees, collecting lagoons and waterways for storm drainage. The pumps circulate 400,000,000 gals. of water each week to keep lagoons and waterways clean and clear. Pumping equipment and station layout are described.

FLUSHING OF SEWER NETWORKS: AUTOMATIC DISCHARGE DEVICE,
A. Lencastre.
Mem Minist Obr Publ, Lisbon, No 109, 1957.

Descriptors: *Automatic control, Instrumentation.
Identifiers: *Sewer flushing.

Investigations were carried out on 3 automatic discharge systems for use in flushing sewers, to determine the effectiveness of automatic operation even at very small rates of flow.
W69-01676

AUTOMATIC CONTROL OF PUMPING INSTALLATIONS,
I. M. E. Aitken, and R. A. F. Craven.
Effluent and Water Treatment Convention, London, 1965. 10 pp.

Descriptors: *Pumping, Automatic control, *Overflow.

In discussing the application of automatic control devices in sewage pumping stations, the authors describe and give a schematic diagram of a single-range control system in which two electrode probes in the inflow-reception sump are used in conjunction with a simple programme controller to control the operation of a number of single-speed pumps of different ratings which can be brought into service in different combinations. The same system can also be used to adjust the rate of pumping in relation to the amount of storm-water overflow and to control the rate of pumping in the recirculation of effluent at sewage works. The basic principles of the system are also applicable when other level-sensing devices are used instead of the electrode probes in the reception sump.
W69-01680

PVC SEA OUTFALL IN HUNSTANTON SEWAGE SCHEME.
Survr Munic Cty Engr, Vol 128, No 3876, pp 22-24, 1966.

Descriptors: Outlets, Storm runoff, *Overflow, *Pumping, Automatic control, Plastic pipes.

An illustrated description, with a plan of the outfall pumping station, is given of the installation at Hunstanton, Norfolk, of a 10-in diameter polyvinylchloride submarine outfall 0.5 mile long, consisting of 20-ft lengths of pipe with acetone cement joints. Subsidiary pumps convey crude sewage to the outfall pumping station; at low tide and normal rates of flow the outfall conveys the sewage under gravity, but at high tide or for high rates of flow the pipeline becomes surcharged and the outfall pumps operate automatically when an overflow sump fills. Provision is made at the pumping station for comminution, the disintegrator being controlled automatically by a lunar clock to operate when the tide is ebbing. Flows in excess of 4.5 times the dry-weather flow are discharged through a separate storm-sewage outfall, a cast-iron pipe extending to the mid-tide mark.
W69-01687

NEW SEWAGE WORKS COMMISSIONED AT LEICESTER.
Survr Munic Engr, Vol 124, No 3773, pp 25-27, Sept. 26, 1964.

Descriptors: *Overflow, *Storm runoff, Weirs, Pumping.
Identifiers: Storage tanks.

These works are designed for a dwf of over 20 million gal and are capable of extension to treat 22 1/2 million gal. On reception, sewage passes through screens and detritors, screenings being returned to flow through disintegrators; washers clean the grit, which is then pumped to a tip at the edge of the works. A weir overflows storm water in excess of 85 million gal/d direct to the River Soar; the residual flow is lifted 12 ft by 6 centrifugal pumps to permit gravitation through the works. Two of these pumps, each of which has a capacity of 7,500 gal/min, are driven by variable-speed motors controlled by electrodes in the pump well, which allows for changes in flow. Two 24-in. diesel-driven pumps are used for pumping to the storm water tanks.

SEWER INFILTRATION.

Water Wastes Eng, Vol 4, No 10, p 22, Oct 1967.

Descriptors: *Sewers, Pipes, Sealants, Pumping, *Biochemical oxygen demand.
Identifiers: *Sewer infiltration, *Residential sewers, *Suspended solids.

Engineers of sewage treatment facilities in six areas of the U.S. were surveyed concerning sewer infiltration: frequency of determination of the extent of infiltration, percentage of sewer flow resulting from infiltration, steps to reduce infiltration, and effect of infiltration on the treatment plant operation. Infiltration was reported to be a problem in each area. Steps used to curb infiltration were: prompt repair of broken or damaged sewers, replacement of sewer pipe with pipes of materials better suited for the area, and enforcement of ordinances prohibiting footing drains and downspouts. High cost prevented the use of sewer linings and chemically-sealed joints. Root infestation was also a problem in each area surveyed. It is the most difficult source of infiltration to locate and correct and may account for as much as 50% of total infiltration. Infiltration affected treatment plant operation by increasing the cost of pumping and reducing BOD and suspended solids. Percentage of the total flow in the sewers resulting from infiltration was estimated to vary between 10 and 50%.

PIPE JOINTS LIMIT INFILTRATION,
G. W. Clark, Jr., and M. L. Leyrer.
Civ Eng, Vol 37, No 1, pp 62-3, Jan 1967.

Descriptors: Sewers, Construction, *Manholes.
Identifiers: *Sewer infiltration.

City engineers in Muskegon, Mich, designed sanitary sewer trunk that would be placed in area having high water table; limiting infiltration was most important; this was accomplished through use of rubber O-ring joint gaskets, and good construction and inspection procedures; tests on completed line show infiltration to between 14.5 and 55.7% of maximum allowable rate of 200 gal/in. of internal diameter per mile of pipe per day; much of this infiltration took place at precast manhole joints, which did not have rubber O-ring joint specified.

LIBRARY U. OF I. URBANA

NEW SERIES

Selected Water Resources Abstracts is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the Clearinghouse for Federal Scientific and Technical Information (CFSTI) of the Bureau of Standards, U. S. Department of Commerce. It is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U. S. Department of the Interior, Washington, D. C. 20240. Annual subscription is $22.00 (domestic), $27.50 (foreign); single copy price is $3.00.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 2, NUMBER 6
MARCH 15, 1969

WR 69-02001 -- WR 69-02400

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

LIBRARY U. OF I. URBANA

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States--now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources. WRSIC is not presently prepared to furnish loan or retention copies of the publications announced.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

LIBRARY U. OF ILL. URBANA

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas. Centers, and their subject coverage, now in operation are:

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I. URBANA

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ROLE OF DIGITAL COMPUTERS IN HYDROLOGIC FORECASTING AND ANALYSES,
For primary bibliographic entry see Field 07C.
For abstract, see .
W69-02245

THE ROLE OF PARAMETRIC HYDROLOGY,
University College, Galway, Ireland.
J. E. Nask.
Instn Water Eng J, Vol 21, No 5, pp 435-474 July, 1967 25 ref.

Descriptors: *Rainfall-runoff relationships, *Hydrographs, Storm runoff, Model studies.
Identifiers: *Calculations.

Parametric hydrology is defined and its advantages, uses and techniques are described. The rational method is briefly described. A method of graphical correlation of observed volumes of storm run-off to the amounts and duration of rainfall and conditions in the basin at the time of the storm is described. The unit hydrograph method of measuring the distribution of run-off in time is presented. Equations and parameters are developed for this method based on basin characteristics and other variables. Conceptual models and hydrologic frequency are discussed. A lengthy discussion follows the paper.
W69-02249

REGRESSION MODELS FOR PREDICTING ON-SITE RUN-OFF FROM SHORT DURATION CONVECTIVE STORMS,
H. A. Schreiber, and D. R. Kincaid.
Water Resour Res, Vol 3, pp 389-395, 1967.

Descriptors: *Storm runoff, *Rainfall intensity, *Model studies.
Identifiers: *Calculations.

Experimental plots were used to study the on-site run-off resulting from 34 summer convective thunderstorms in the Walnut Gulch experimental watershed, Ariz. It was found that run-off increased with increase in precipitation and decreased as antecedent soil moisture and crown spread of vegetation increased. Six independent variables were used in a step-wise multiple linear regression equation to determine the importance of total quantity per storm in inches; maximal 5-minute intensity in inches per hour; and duration of storm in minutes.
W69-02260

WATER YIELD MODEL DERIVED FROM MONTHLY RUNOFF DATA,
W. M. Snyder.
Int Geodetic and Geophysical Union-Sec for Sci Hydrology Publ No 63, pp 18-30, 1964.

Descriptors: *Rainfall-runoff relationships, Runoff, Watersheds, Model studies.
Identifiers: *Calculations.

Mathematical model has been developed to analyze past records of streamflow and to predict dependable yield from watersheds under varying patterns of rainfall; model contains three parts; first, seasonal rainfall function generates potential runoff in two phases--immediate and delayed; second, distribution function delivers delayed runoff to future streamflow; third, time-trend function compensates for changing watershed conditions; ten test sets of data were analyzed.
W69-02266

SIMPLIFIED VERSUS OPTIMUM UNIT HYDROGRAPHS - ONE COMPARISON,
W. W. Snyder.
Water Resources Res, Vol 3, No 4, pp 947-948, 1967.

Descriptors: *Hydrographs, *Rainfall-runoff relationships.
Identifiers: *Urban hydrology.

A unit hydrograph is derived from a record storm previously analyzed for the optimum realizable unit hydrograph. The storm data, an urban rainfall-runoff event, and original analysis are given in Eagleson. et al Water Res. Res 2 (4):755. The simplified curve-fitting procedures produce a more rational appearing unit hydrograph in this case study.
W69-02267

RAINFALL AND RUN-OFF IN THE DERWENT VALLEY TO YORKSHIRE BRIDGE, DERBYSHIRE,
R. W. S. Thompson, and K. J. H. Saxton.
Proc Instn Civ Engrs, Vol 25, Paper No 6664, pp 147-164, 1963.

Descriptors: *Rainfall-runoff relationships.

Tabulated hydrometric data over the past 60 years are given for the catchment area of the Derwent Valley Water Board on the river Derwent in north Derbyshire. The relations between rainfall and run-off in the area are discussed.
W69-02272

HYDROLOGICAL OBSERVATIONS,
S. J. van Kregten.
Verslagen en Mededelingen, No 9-Verslag van de Technische Bijeenkomst, No 18, pp 12-27, 1963.

Descriptors: *Rainfall-runoff relationships, Discharge (Water), *Hydrographs, Storm runoff, Surface runoff, Groundwater.
Identifiers: *Calculations.

Hydrological observations; elements of transformation of precipitation to runoff are given on basis of diagram of hydrological cycle; methods used to determine discharge from rainfall are reviewed, with special attention to unit-hydrograph method for surface runoff; analytical method developed in Netherlands for calculation of groundwater discharge; behavior of flood wave in open channels is discussed.
W69-02273

CHARACTERISTICS OF THE INLET HYDROGRAPH,
W. Viessman, Jr., and J. C. Geyer.
ASCE Proc, J of Hydr Div, Vol 88, No HY5, p 245, 1962.

Descriptors: *Rainfall-runoff relationships, *Intakes, *Rainfall intensity, Roughness (Hydraulic), Runoff, *Hydrographs.
Identifiers: *Urban drainage, *Surface permeability.

The results of a study of the relationship between rainfall and runoff for impervious inlet areas are presented. An attempt has been made to include as many significant variables as possible. Prominent among the latter were antecedent rainfall storm intensity and pattern, and size, slope, and roughness of the inlet areas. Data from records on impervious areas in Baltimore, Md., Newark, Del., and Hertfordshire, England. Equations for peak rates of runoff, rise of hydrograph, and method proposed for predicting shape of simple hydrograph.
W69-02275

A HYDRAULIC MODEL FOR THE CATCHMENT-STREAM PROBLEM. III. COMPARISON WITH RUN-OFF OBSERVATIONS,
R. A. Wooding.
J Hydrol, Vol 4, pp 21-37, 1966.

Descriptors: *Model studies, *Rainfall intensity, Discharge (Water), *Hydrographs, *Rainfall-runoff relationships, Drainage.

The application to field measurements of a hydraulic model of a V-shaped catchment draining into a stream situated in the apex of the V is discussed, together with the mode of determination of unknown parameters after choosing parameters for the rainfall intensity scale, catchment equilibrium time, the scale of the discharge hydrograph, and the ratio of stream-equilibrium time to catchment equilibrium time. Comparisons of discharge hydrographs calculated from the theoretical model are made with those from catchment areas at Cashmere, New Zealand, and at Alice Springs and Warragamba Dam, Australia. Improvements are suggested, including the need for a better geometrical description of the stream network in examples, and it is pointed out that a more efficient treatment of infiltration losses might be possible with a model based on stream networks.
W69-02277

HYDRAULIC MODEL FOR CATCHMENT-STREAM PROBLEM,
R. A. Wooding.
J Hydrology, Vol 3, No 3-4, pp 254-82, 1965.

Descriptors: *Model studies, Discharge (Water), *Hydrographs, Rainfall intensity, *Rainfall-runoff relationships.

Analytical solutions for hydraulic model are obtained by method of characteristics, firstly, for flow over plane V-shaped catchment under constant uniformly-distributed rainfall of finite duration, and secondly, for stream outflow arising from catchment discharge predicted form of stream hydrograph is calculated numerically, assuming that rainfall is of constant intensity and of finite duration.
W69-02278

WATER-OUR SECOND MOST IMPORTANT NATURAL RESOURCE,
Rensselaer Polytechnic Institute.
Donald B. Aulenbach.
Boston College Ind and Com L Rev, Vol 9, No 3, pp 535-552, Spring 1968. 18 p, 42 ref.

Descriptors: Chemical properties, Electrical properties, Compressability, Ionization, Surface tension, *Hydrologic cycle, *Rainfall runoff relationships, *Surface runoff, Evapotranspiration, Water balance, Groundwater, Recharge, Lakes, Desalination, Consumptive use, Water yield improvement, Distribution, *Economic feasibility.

The importance of water to man and its unique properties are summarized. In order to determine the supply of usable water an inventory of the earth's total supply is set forth in table I. 99.2% of the supply, comprised of salt water and glaciers, is virtually unusable. 98.3% of the remainder is groundwater, 50% of which is reasonably accessible. Stream runoff is the portion which is readily available to man. Presently there is an annual water use in the United States of 450 million acre feet per year with an average stream runoff of 1372 million acre feet per year. This potential supply is not necessarily unpolluted, however, although at present there is sufficient available water to meet demands. Tables are included with a breakdown of water uses showing a tenfold increase in the last 70 years with the greatest increases in power generation and industrial uses. Due to population increases and increased industry it is estimated that by 1980 water demands will exceed the amount of water readily available. Four methods are suggested for increasing the supply: desalting sea water; imports from areas of large supply; weather modification; and salvage measures. The feasibility of each is discussed. It is suggested that demand might be reduced by raising water prices. (Kahle-Fla)

LIBRARY U. OF I. URBANA-CHAMPAIGN

THE EFFECTS OF URBANIZATION ON UNIT HYDROGRAPHS FOR SMALL WATERSHEDS, HOUSTON, TEXAS, 1964-67,
W. H. Espey, Jr., and D. E. Winslow.
Rep by TRACOR, Sept 1968; Vol 1, Doc No 68-975-U, text, 70 p, 19 fig, 8 tab, 8 ref, Contract No. 14-01-0001-1580; Vol 2, Doc No 68-1006-U, append-data compilation, 244 p, many fig and map, 10 ref. OWRR Supported by Title 11, Water Resources Act, 1964.

Descriptors: *Urbanization, *Storm runoff, *Rainfall-runoff relationships, *Unit hydrographs, Regression analysis, Drainage systems, Land use, Roads, Vegetation effects, Infiltration, Small watersheds, Environmental engineering.
Identifiers: Linear regression analysis, Houston (Texas), Urban watersheds.

Rainfall-runoff relations were studied on several small watersheds in Houston, Texas, to learn the effects of urbanization and to develop equations to describe the effects of urbanization on unit hydrographs. Rainfall and runoff data from 11 urban and 6 rural watersheds were reduced and 30-minute unit hydrographs obtained. This was combined with previously reduced data for 22 urban and 11 rural watersheds. The Houston Urban Project of the USGS, WRD, provided most of the basic data. Multiple linear regression analysis was used to develop equations to describe the 30-minute unit hydrograph for urban and rural conditions. These equations were compared to previously derived equations and the equations of best fit were determined. The equations are used to predict effects on the unit hydrograph of changes in impervious cover, channel conditions and secondary drainage facilities due to urbanization. Applied to Houston watersheds they indicate that in changing from a rural to a highly urbanized condition the 30-minute unit hydrograph may show an increase in peak discharge of up to 500% and a decrease in time of rise of up to 90%. Appendices published in a separate volume contain unit hydrographs, descriptions and maps of the watersheds, basic hydrologic data, and equations developed by regression analysis. (Knapp-USGS)

2B. Precipitation

DOUBLE-MASS ANALYSIS ON COMPUTER,
R. Singh.
ASCE Proc, J Hydraulic Div, Vol 94, No HY 1, Paper 5729, pp 139-42, Jan 1968.

Descriptors: *Computer programs, *Precipitation.
Identifiers: *Calculations.

Hydrologists use double-mass analysis to verify consistency of precipitation or streamflow record; precipitation of station is plotted against combined precipitation of surrounding stations; consistency of record is verified if single straight line fitted through points is reasonable; analysis is done on computer by fitting straight line and fourth-degree polynomial through points and comparing two sums of squares of deviations of points from fitted curves; if record is found to be inconsistent, it is adjusted by bringing deviated points along desired single straight line; method should be of value to hydrologists having access to computers.
W69-02263

RAINFALL RATES OF HEAVY RAINS IN BREMEN,
W. Storch, and F. W. Boll.
Gas-Wasserfach, Vol 109, No 6, pp 156-157, 1968.

Descriptors: *Rainfall intensity.
Identifiers: *Calculations, *Bremen (Germany).

Recent measurements of the rainfall intensity-duration relationship, which the municipal authorities of Bremen, Germany carried out at four measuring stations, have shown that the rainfall intensity-duration curve used for years does not correspond to present conditions. The old value was in error of 67% for 25 minutes. A new rainfall intensity-duration curve was constructed using Hoerler's method, which provided the author with data that could be used to determine rainwater rates for rainfalls of any duration and frequency. The newly constructed curve not only differs greatly from the old data, but also disagrees with the Reinhold data so far accepted as valid for the whole northwestern part of Germany.
W69-02269

STORM STUDIES IN SOUTH AFRICA-SMALL-AREA HIGH-INTENSITY RAINFALL,
W. van Wyk, and D. C. Midgley.
Civ Engr in South Africa, Vol 8, No 6, pp 188-97, June 1966.

Descriptors: *Rainfall intensity, *Design.
Identifiers: South Africa.

Intensity-duration-frequency relationships, time distribution of intense rainfall, and areal distribution of rain within intense storms are dealt with; to enable relationships to be extended to ungaged localities, coaxial plot of intensity, duration, frequency, mean annual rainfall and rainfall region is presented; dimensionless curve is provided as basis for synthesizing mass curve of rainfall during 'design storm'; third diagram is presented as basis for determining isohyetal pattern of design storm; application to design is illustrated by example.
W69-02274

ARIDITY DEFINITIONS AND THEIR APPLICABILITY,
Swedish Meteorological and Hydrological Institute, Stockholm.
C. C. Wallen.
Geografiska Annaler, Vol 49A, No 2/4, pp 367-384, 1967. 18 p, 4 fig, 2 tab.

Descriptors: Water balance, Climatic data, Arid climates, Semiarid climates, Investigations, *Climatology, Meteorology, *Equations, *Temperature, Precipitation, Evapotranspiration, *Rainfall.
Identifiers: *Aridity, *Indices, Agricultural potential, Near East, Agroclimatology.

A review of the various approaches to the problem of defining aridity were given. The classical, Index, and water-balance approaches were discussed with particular emphasis on a critical analysis of the different indices developed by Koppen, deMartonne, Emberger, and Gaussen. In the latter part of the article a summary was given of an investigation, which was an attempt to establish from the available climatological information, the agricultural potentialities of the semi-arid and arid regions in the Near East. The countries involved were Lebanon, Syria, Jordan, Iraq, and Iran. The results from a purely classical approach were compared with an approximate determination of the water-balance conditions based on Penman's formula. (Affleck-Ariz)
W69-02384

2C. Snow, Ice, AND Frost

A PRELIMINARY ESTIMATE OF THE ICE-SEASON ENERGY BALANCE FOR THE NIAGARA RIVER,
Meteorological Service of Canada, Ontario, Hydrometeorology Section.
H. L. Ferguson.
Bull Int Assoc Sci Hydrol, Vol 13, No 3, pp 41-58, Sept 1968. 18 p, 2 fig, 9 tab, 20 ref.

Descriptors: *Heat budget, *Rivers, *Ice, *Climatic data, *Hydrologic data, Freezing, Melting, Radiation.
Identifiers: *Energy balance, Niagara River, Canada.

Part of a study by the Meteorological Service of Canada and the Ontario Hydro-electric Power Commission on ice formation and dissipation on the upper Niagara River is an estimated energy budget of the river, based on long term climatological data and on hydrological observations made in the 1967 ice season. The measured and estimated terms in the energy budget are net incoming radiation, net energy loss by evaporation, conduction to the atmosphere, loss by snowmelt, incoming advected energy, outgoing advected energy, and net gain in energy storage. Storage and advection are the most difficult to measure or accurately estimate. Ice forecasting methods by multiple-regression methods may be possible. Lack of precision in measurements of storage and advection terms limits the use of the energy budget equation as a direct ice-prediction method. (Knapp-USGS)
W69-02335

2D. Evaporation and Transpiration

RAINFALL AND EVAPORATION: DISTRIBUTION IN SPACE AND TIME,
P. J. Meade.
J Inst Water Eng, Vol 21, No 3, pp 210-215, May 1967.

Descriptors: *Rain gages, *Data collections, *Rainfall intensity.
Identifiers: Urban drainage.

The Meteorological Office is undertaking intensive research into the problems of the measurement, collection, and analysis of data on rainfall and subsequent evaporation to use in future planning of both water resources and water disposal. Water disposal problems requiring an accurate analysis of rainfall data include: urban drainage, roof drainage, protection of dams, embankments for railways and roads, etc. However, meteorologists are aware of another set of problems which must be attacked with determination if a comprehensive service of information and advice is to be provided in this field. These problems are concerned with the forecasting of rainfall, the time of onset, the duration, and the quantity that will fall; they range over a wide area of meteorology from the physics of clouds to the large-scale movements of the general circulation of the atmosphere.
W69-02247

SPRING TRANSPIRATION OF THREE DESERT SPECIES,
Nevada Univ., Reno, Nevada. Desert Research Institute.
N. Stark.
J Hydrol - Amsterdam, Vol 6, No 3, pp 297-305 June 1968. 9 pp, 3 fig, 1 tab.

Descriptors: *Transpiration, Desert plants, Sagebrush, Rabbitbush, *Hygrometry, *Water loss, Arid climates, Growth rates, Lysimeters, *Leaves, *Spring, Weight, Data collections, Sun.
Identifiers: Horsebrush, Hygrosensor, Dry leaf weight, Dry sites, Wet sites, Shade.

Transpiration rates of sagebrush, rabbitbrush and horsebrush were determined at a site north of Reno, Nevada. The techniques that were used explored the possibility of using the grams of water lost per gram of dry leaf weight as a basis for defining transpiration rather than the conventional method of relating loss to leaf surface area. The weight approach was being studied because it was impossible to accurately determine the surface area of many desert species. The hygrosensor area transpirometer used in the study made it possible to compare water loss from whole, living plants of the same species growing in close proximity on wet and

dry sites in the field. Data which were not corrected for weight differences showed that sagebrush lost more water per plant per minute than did rabbitbrush on a dry site. Rabbitbrush transpired more rapidly on a dry site per gram of dry weight than did sagebrush. The dry weight of leaves was a more desirable reference for transpiration rate than was leaf area which was used for broad-leaved plants. (Blecker-Ariz)

WATER LEVEL FLUCTUATION IN EVAPOTRANSPIROMETERS,
U. S. Geological Survey, Phoenix, Arizona. Water Resources Div.
T. E. A. Van Hylckama.
Water Resources Research, Vol 4, No 4, pp 761-768, Aug 1968. 8 p, 5 fig.

Descriptors: *Evapotranspiration, Diurnal, Heating, Cooling, Tidal effects, *Water level fluctuation, Tamarisk, *Instrumentation, *Fluctuation, Transpiration, *Atmospheric pressure, Temperature.
Identifiers: *Evapotranspirometers, *Tanks, Plastic lining.

The effects of diurnal variation due to daily heating and cooling of the air and semi-diurnal variations due to the tidal effects of the moon on water levels in eleven plastic lined evapotranspirometers were studied in Buckeye, Arizona. Eight of the tanks were planted to salt cedar and three were left bare. The levels of the artificially maintained ground water in these instruments showed distinct diurnal fluctuations. Such a response was thought to be due to either air bubbles in the saturated zone, or the flexible plastic lining of the tank. On vegetated tanks that were transpiring the water level and the barometric curves were out of phase but if the water levels were corrected for atmospheric pressure fluctuations a curve appeared that represented the hourly rate of water use. (Affleck-Ariz)
W69-02382

USE OF ATMOMETERS IN ESTIMATING EVAPOTRANSPIRATION,
California Dept. of Water Resources, Sacramento, California.
John W. Shannon.
J. Irrig and Drain. Div ASCE. Vol 94, No IR3, Proc Paper No 6120. pp 309-320, Sept. 1968.

Descriptors: *Atmometers, Instrumentation, Evaporation, *Climatic data, *Evapotranspiration, Evaporation pans, Water requirements, Data collections, Energy, *Monthly, *Seasonal, Water loss.
Identifiers: Evaporative demand, Crop coefficients.

Studies conducted by the California Department of Water Resources during the past 10 years show that Livingston black and white spherical atmometers provided a practical means of estimating monthly and seasonal evapotranspiration. The difference of evaporation between the black and white atmometers was affected primarily by short wave energy, whereas evaporation from either the black or white atmometer provided an index of the total amount of energy available for evapotranspiration. Various studies were made, the results of which indicated that the type of background has little effect upon the difference in evaporation between the black and white atometers. Monthly crop coefficients were developed for some of the principal crops in the Central Valley of California, which provided evapotranspiration estimates consistently as good as or better than could be obtained using coefficients developed from United States Weather Bureau Class A evaporation pan data. (Affleck-Ariz)

THE GAS DIFFUSION POROMETER TECHNIQUE AND ITS APPLICATION TO THE MEASUREMENT OF LEAF MESOPHYLL RESISTANCE,
Hebrew Univ of Jerusalem, Dept. of Botany.
J. Gale, Alexandra Poljakoff-Mayber, and I. Kahane.
Israel J Bot, Vol 16, No 4, pp 187-204. 1967. 18 p, 3 fig, 4 tab.

Descriptors: *Transpiration, Measurement, *Leaves, Pores, Gases, Absorption, Carbon dioxide, Diffusion, Photosynthesis, Plant physiology, Stomata, Equations, *Resistance, *Water vapor, *Water loss, Vapor pressure, Density.
Identifiers: Air vapor density gradient, Mesophyll, *Gas diffusion porometer, Porometers.

A critical study of the use of the diffusion porometer method for the evaluation of mesophyll resistance to water vapor loss was conducted by the authors. Apparently significant mesophyll resistance was found in maize leaves under conditions of low leaf to air vapor pressure gradients. Calculations showed that this resistance had a considerable effect on transpiration and on the estimation of mesophyll resistance to carbon dioxide uptake. Due to the considerable experimental error inherent in the technique, this finding should be treated with reservation. Negative values of mesophyll resistance were found in maize leaves subjected to high vapor pressure gradients and in beans even under conditions of low vapor pressure gradients. These results were ascribed to the development of a tortuosity resistance which was greater than the series sun of the internal resistances to diffusion from the separate sides of the leaf. VARIATION OF RUN-OFF COEFFICIENT,
K. J. Mawson.
N Z Eng, Vol 14, 38, 1959.

Descriptors: *Drainage system, *Storm runoff, *Runoff forecasting, Storms, *Rainfall intensity, Design.
Identifiers: *Urban drainage, *Wellington (N.Z.).

At Wellington, N.Z., for about 30 years, stormwater drainage systems have been designed satisfactorily on the basis of the runoff-estimated by the rational method, which assumes that the highest peak flows from small catchments are produced by storms of the short-duration, high-intensity type, and generally makes no provision for prolonged falls of relatively low intensity. Data on the rainfall and floods in the residential suburb of Karori and in the bush-covered Wainui water-supply catchment area are presented and discussed with particular reference to the behavior of the run-off coefficient. It is concluded that the short-period high-intensity type of storm does not produce peak floods as high as those attained in longer storms of more moderate intensity, and that the rational method is valid for designing drainage systems for the prolonged type of storm. The run-off coefficient can be calculated with reasonable accuracy by the method in the 'Provisional Standard' of the Soil Conservation and Rivers Control Council, N. Z.
W69-02246

EFFECTS OF CLIMATOLOGIC AND BASIN CHARACTERISTICS ON ANNUAL RUN-OFF,
S. E. Mustonen.
Wat Resour Res, Vol 3, pp 123-130, 1967.

Descriptors: *Runoff forecasting, Surface runoff.
Identifiers: *Calculations, Surface permeability, Finland.

Regression analysis was used to select climatological and basin characteristics affecting the annual run-off in Finland. Seasonal precipitation and mean annual temperature were found to be much more important than basin characteristics such as soil type and vegetation; frost depth was inversely related to run-off; while percentage areas of cultivated land and peat land were not significant factors. The statistical methods used are explained and discussed.

METHODS OF DETERMINING SURFACE DISTRIBUTION OF EXCESSIVE RAINFALLS,
J. Petrlik.
Int Geodetic and Geophysical Union-Sec for Sci Hydrology Publ No 65 pp 303-8, 1964.

Descriptors: Rain gages, *Rainfall intensity, Surface runoff.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: *Calculations.

Investigation of surface distribution of heavy rainfalls in area of four largest towns in Czechoslovakia using rain gaging data of 25 yr period 1925-1949; two basic characteristics determined for rainfalls were relation between maximum intensity of total rainfall in mm/min and its duration in place of maximum intensity in minute; equation of horizontally diminishing intensity of heavy rainfalls was determined empirically.
W69-02251

COMPARISON OF SOME FORMULAS FOR DETERMINING THE SNOW MELT (PRELIMINARY RESULTS),
N. Rachner.
Wasserwirtsch-Wassertech, Vol 18, No 1, pp 10-12, Jan 1968.

Descriptors: *Snowmelt, *Runoff forecasting, *Discharge (Water), Flood control.
Identifiers: *Calculations.

Run-off forecasts, especially the snow-melt water discharge prognoses, gain continuing significance in flood prevention and water management. To present a survey of possible methods and, simultaneously, to show the order of magnitude of ommissions pertaining to the simpler methods, a selection and comparison of various formulas found in the literature is made. The statements are illustrated by examples.
W69-02252

SURFACE-WATER HYDROLOGY OF CALIFORNIA COASTAL BASINS BETWEEN SAN FRANCISCO BAY AND EEL RIVER,
S. E. Rantz, and T. H. Thompson.
U S Geol Survey-Water Supply Paper 1851, 1967. 60 pp, map.

Descriptors: *Surface runoff, Planning.
Identifiers: California.

Hydrologic information for use in project planning by California Department of Water Resources and other water agencies operating in State; study of runoff regimen indicates that, for any stream, there is close relationship between flow-duration curve and frequency curves for low flows of various durations; magnitude and frequency of high flows, for durations ranging from 1 day to 274 days, were analyzed by method that closely paralleled that used in flood-frequency study.

LONG-RANGE FORECAST OF CRITICAL DATES OF SPRING DISCHARGE HYDROGRAPH FROM LOCAL INDICES OF ATMOSPHERIC CIRCULATION,
M. V. Rudometov.
Am Geophysical Union. Soviet Hydrology-Selected Papers, No 1, pp 31-46, 1964.

Descriptors: *Runoff forecasting, *Flood forecasting, *Hydrographs, Discharge (Water).
Identifiers: Russia.

Methods of long-range forecasting of dates of beginning of spring high water and dates of onset of maximum discharge based on use of local indices of atmospheric circulation, taking Desna River at city of Chernigov in Ukraine as example.
W69-02256

MAGNITUDE AND FREQUENCY OF STORM RUNOFF IN SOUTHEASTERN LOUISIANA AND SOUTHWESTERN MISSISSIPPI,
V. B. Sauer.
U S Geol Survey-Prof Paper 501-D, pp 182-4, 1964.

Descriptors: *Storm runoff, Storms, Discharge (Water).
Identifiers: *Calculations.

Graphical correlations indicate that mean annual, or 2.33-yr, storm runoff for any site in area is 64 sec-ft-days/sq mi, which is equivalent to uniform depth of 2.38 in.; recurrence interval of individual storm runoff will, in many instances, be significantly different from recurrence interval of peak discharge resulting from same storm.
W69-02257

SYNTHESIS OF INLET HYDROGRAPH,
J. C. Schaake, Jr.
Johns Hopkins Univ-Dept Sanit Eng and Water Resources-Tech Report 3, June 1965. 105 p.

Descriptors: *Hydrographs, *Intakes, *Surface runoff, Storms, *Computer programs, *Drainage systems.
Identifiers: Calculations, Surface permeability.

Method is presented for synthesizing hydrograph of runoff from paved portions of drainage area; method involves application of equations of gradually varied unsteady flow in open channels to describe mechanics of surface runoff; method of synthesizing inlet hydrograph will provide means for developing records of runoff for inlet areas of sufficient length to have statistical significance; advantage of method is that drainage area behavior can be simulated on computer so response of area to arbitrary or spatially varied rainfall can be accurately predicted.
W69-02258

EXPERIMENTAL EXAMINATION OF RATIONAL METHOD,
J. C. Schaake, Jr., J. C. Geyer, and J. W. Knapp.
ASCE Proc, J Hydraulics Div, Vol 93, No HY 6, paper 5607, pp 353-70, Nov 1967.

Descriptors: *Rainfall-runoff relationships, Drainage, Runoff, *Rainfall intensity, Storm runoff, Design.
Identifiers: *Calculations, *Urban drainage, Baltimore (Md.).

Rainfall and runoff data collected in Baltimore, Md, from 20 gaged urban drainage areas ranging in size up to 150 acres have been used in study of Rational Method; results suggest that frequency of occurrence of computed design peak runoff is same as frequency of occurrence of rainfall intensity selected by designer with appropriate C; in accordance with their usual design procedures, five storm drainage designers used Rational Method to estimate 5 yr design peak runoff rates for six gaged drainage areas; these values are compared with runoff values from runoff frequency curves for these gaged areas.
W69-02259

USE OF ANALOG MODELS IN ANALYSIS OF FLOOD RUNOFF,
J. Shen.
U S Geol Survey-Prof Paper 506-A, 1965. 24 p.

Descriptors: *Computer programs, *Flood forecasting, Runoff.

Quasi-linear analog model has been developed for simulating runoff-producing characteristics of drainage system; where storage is linear unique relationship correlating inflow and outflow peaks is derived; technique for synthesizing flood-frequency distribution is also proposed, whereby effects of linear- or nonlinear-basin system upon its inflow probability distributions are examined.
W69-02261

NON-LINEAR INSTANTANEOUS UNIT-HYDROGRAPH THEORY,
K. P. Singh.
ASCE Proc, J Hydr Div, Vol 90, No HY2, Paper No 3852 pp 313-347, 1964.

Descriptors: *Hydrographs, *Storms, *Surface runoff.
Identifiers: *Calculations.

A theory has been developed, using a non-linear approach, to account for the apparent variations in instantaneous unit hydrographs derived from different storms over a given drainage basin. Excess rainfall with a non-uniform areal and time distribution is transformed to a direct surface run-off hydrograph at the basin outlet, with consideration of the effect of both overland and channel flows. The characteristics of such flows vary from place to place in any drainage basin, and their effects on the instantaneous unit hydrograph are considered in terms of the translation and storage factors of these flows over the basin. Analyses of storms over 6 drainage basins gave consistent results, indicating that the proposed equation can be used satisfactorily for instantaneous unit hydrographs.
W69-02262

BASIC GEOGRAPHICAL AND HYDROCHEMICAL CHARACTERISTICS OF LOCAL RUNOFF OF NATURAL ZONES IN EUROPEAN TERRITORY OF U S S R,
B. G. Skakal'skiy.
Soviet Hydrology-Selected Papers, No 4, pp 389-434, 1966.

Descriptors: *Precipitation, *Surface runoff, Groundwater, *Hydrographs, Discharge (Water).
Identifiers: Russia.

Consideration is given to physiographic conditions of formation from atmospheric precipitation, falling on surface of catchments, of waters of various origin that make up local runoff; volumes of waters of various origin (surface-slope, soil-surface, topsoil-ground and ground-water) are determined by genetic separation of discharge hydrographs of small rivers; on basis of material thus obtained, quantitative description is given of genetic categories of runoff developing in specific hydrologic periods on small catchments for year of average hydrometeorological conditions, and their zonal features are established.
W69-02264

PERCOLATION, GROUND-WATER DISCHARGE, AND STREAM FLOW IN THE NIDD VALLEY,
K. J. Smith.
J Instn Water Engrs, Vol 20, pp 459-471, 1966.

Descriptors: *Groundwater, *Discharge (Water), Drainage, Rain, *Runoff, *Rainfall-runoff relationships.
Identifiers: Calculations, Surface permeability.

Records of drainage, taken from a percolation gauge at Harlow Hill, near Harrogate, Yorks., were compared with values for stream flow, rainfall and run-off in the Nidd valley, Yorks., at 2 catchment areas, Hunsingore and Howstean. It was found that the response of percolation to rainfall was similar to that of run-off to rainfall, and this was particularly marked if mean values were taken over a long period. Statistical analysis showed that the relation between run-off and measured drainage was closest during winter and autumn, with correlation coefficients of 0.87 and 0.86 respectively; on the other hand there was a large discrepancy between infiltration at Hunsingore and measured drainage at Harlow Hill. It was concluded that the percolation gauge is not a satisfactory instrument for measuring effective infiltration and that results obtained from it should be compared with run-off characteristics when the gathering grounds are relatively impermeable.
W69-02265

NOMOGRAMS FOR THE DETERMINATION OF ANTICIPATED WATER DISCHARGE IN PLANNING RAIN RUN-OFF SYSTEMS,
A. N. Sorokin.
Vodosn Sanit Tekh, No 5, pp 12-14, 1960.

Descriptors: *Runoff forecasting, *Design.
Identifiers: Calculations, *Storm sewers.

Equations and nomograms are given for estimating the amount of run-off to be allowed for when designing storm-water sewers.

HYDROLOGIC RECONNAISSANCE OF POINT REYES NATIONAL SEASHORE AREA, CALIFORNIA,
U S Geological Survey.
R. H. Dale, and S. E. Rantz.
U S Geol Surv Open-file report, 37 p, 1966. 16 fig, 9 tab.

Descriptors: *Water resources, Surface waters, *Groundwater, *National seashores, *California, Hydrogeology, Water wells, Streamflow, Water quality, Springs, Water yield, Water demand.
Identifiers: Point Reyes National Seashore.

The water resources of Point Reyes National Seashore were investigated to appraise sources of water supply at park sites where visitor accommodations are proposed. Point Reyes is a peninsula on the California coast 50 mi N of San Francisco. Its altitude ranges from sea level to 1,400 ft. Precipitation is seasonal; 75% of the 20-40 in. is in Nov through March. Runoff ranges from 6-16 in. About 90% of the runoff is in Dec through April when demand is at its minimum. Summer streamflow is inadequate at beaches in the northern part of the area and adequate at all other proposed visitor centers. Small groundwater supplies less than 25 gpm, can be developed at most sites from terrace sand and gravel deposits. The quality is generally good but iron content maybe high enough to cause problems. (Knapp-USGS)
W69-02279

QUALITY OF SURFACE WATERS OF THE UNITED STATES 1960--PARTS 7 AND 8: LOWER MISSISSIPPI RIVER BASIN AND WESTERN GULF OF MEXICO BASINS.
U. S. Geological Survey.

U S Geol Surv Water-Supply Pap 1744, 548 p, 1968. 1 fig, 33 ref.

Descriptors: *Data collections, *Surface waters, *Water quality, *Mississippi River Basin, Discharge (Water), Hardness (Water), Dissolved solids, Suspended load, Conductivity.
Identifiers: Gulf of Mexico River Basins.

The surface water quality data of the Lower Mississippi River Basin and the Western Gulf of Mexico Basins for 1960 are tabulated. The records are arranged by drainage basins in downstream order. Daily and monthly samples were collected at 178 of 195 stations for chemical analysis. Temperature was measured daily at 103 stations. Suspended sediments were measured at 22 stations. Chemical analysis reports include station location, drainage area, available records, extremes, dates of collection, discharge, concentrations of silica, Fe, Cd, Mg, Na, K, Bicarbonate, carbonate, sulfate, Cl, F, Nitrate, B, Total solids, hardness, SAR, conductance, and pH. WATER-RESOURCES APPRAISAL OF MESQUITE-IVANPAH VALLEY AREA, NEVADA AND CALIFORNIA,
U. S. Geological Survey, Carson City, Nev., Water Resources Div.
Patrick A. Glancy.
Nev Dep of Conserv and Natur Resources, Water Resources - Reconnaissance Serv Rep 46, 57 p, June 1968. 2 fig, 1 plate, 2 photo, 18 tab, 34 ref.

Descriptors: *Water resources, *Groundwater, *Nevada, Surface waters, Aquifers, Water yield, Rainfall, Recharge, Discharge (Water), Evapotranspiration.
Identifiers: Mesquite-Ivanpah Valleys (Nevada).

A reconnaissance survey was made of the Mesquite-Ivanpah Valley area which includes 4 valleys in southern Nevada with a total area of about 830 sq mi. All the groundwater recharge is from precipitation. Total runoff is estimated to be 2,100 acre-ft per year. Estimated annual precipitation is 430,000 acre-ft and recharge is 3,100 acre-ft, less than 1% of precipitation. The known and developed aquifers are in the valley fill alluvium but abundant carbonate rocks are probably a significant aquifer system. Discharge in Mesquite Valley is by evapotranspiration but in the other valleys it is apparently by subsurface outflow. Water quality ranges from good near recharge areas to very poor near discharge areas and at great depth. Present use in Mesquite Valley is about half the estimated perennial yield and in the other valleys it is less than 10% of estimated perennial yield. (Knapp-USGS)
W69-02340

EFFECT OF DROUGHT ON STREAM QUALITY IN NEW JERSEY,
U. S. Geological Survey, Trenton, New Jersey.
Peter W. Anderson, and John E. McCall.
ASCE Proc, J Sanit Eng Div, Vol 94, No SA 5, Pap 6138, pp 779-788, Oct 1968. 10 p, 8 fig, 1 tab, 7 ref.

Descriptors: *Droughts, *Water quality, *Surface waters, *New Jersey, Streamflow, Biochemical oxygen demand, Turbidity, Dissolved solids, Dissolved oxygen, Saline water intrusion.
Identifiers: *Drought effects, Tidal-saline invasions, Delaware estuary.

The drought of 1961-1966 was studied to learn its effect on water quality in New Jersey streams. The cumulative departures of precipitation and streamflow and use of 12-month moving average analysis of water quality information showed a definite relation of water quality to water deficiency. Abnormally high dissolved solids contents, coliform bacteria counts and BOD occurred as well as abnormally low dissolved oxygen and suspended sediment content and further than usual intrusion of saline water into estuaries. The maximum effect of drought was observed in late 1965 and early 1966. Some effects, such as low streamflow, were still observable a year after the drought ended. (Knapp-USGS)

FLOW OF THE RIO GRANDE AND RELATED DATA - FROM ELEPHANT BUTTE DAM, NEW MEXICO TO THE GULF OF MEXICO - 1966.
International Boundary and Water Commission, U. S. and Mexico.

Int Boundary and Water Comm, U S and Mex, Water Bull No 36, 155 p, 1967. 2 map.

Descriptors: *Data collections, *Surface waters, *Discharge (Water), *Water quality, *Rio Grande, Gaging stations, Reservoirs, Irrigation.
Identifiers: International Boundary and Water Commission (U S-Mexico).

Stream discharges and related data of the international part of the Rio Grande are presented. The streamflow data tabulated include gaging station description, period of record, descriptions of man-made changes in flow affecting the river near each station, mean daily discharge, and calculated extreme and average flow for the year and the period of record at each station. Diversions and stored water records are listed. Chemical quality data include suspended silt, chemical analyses, electrical conductivity, salt load, and sanitary aspects of quality. Climatological data listed include rainfall in the Rio Grande Basin, rainfall on subdivisions of the basin, location of rainfall stations, evaporation, temperature, humidity, wind, basin area above each gaging stations, and irrigated areas influencing streamflow at each gaging station. (Knapp-USGS)

EFFECTS OF CYCLONE BEULAH ON THE YUCATAN PENINSULA (SPANISH),
Edmundo Hernandez Serrano.
Ingenieria Hidraulica en Mexico, Vol 22, No 2, pp 181-188, 1968. 8 p, 1 map, 12 photo.

Descriptors: *Floods, *Hurricanes, *Tropical cyclones, *Flood damage, *Economic impact, Storm runoff, Precipitation excess, Winds.
Identifiers: *Mexico, *Yucatan Peninsula, *Cyclone Beulah.

Some lasting effects of tropical cyclone Beulah in Mexico are reported. The second tropical disturbance formed in the Atlantic in 1967, Beulah, entered the Yucatan Peninsula the evening of September 16 with winds of 180 kph and torrential rains. The hurricane destroyed 90% of the rural dwellings on the Peninsula, crops valued at 50 million pesos and other agricultural facilities amounting to 15-1/2 million pesos, in addition to destroying or damaging livestock and forests. Fishing activities were disrupted for over 30 days resulting in losses to the economy of 5 million pesos. Total inhabitants suffering from Beulah's effects reached 17,000 in urban areas and 60,000 in rural areas. (Llaverias-USGS)
W69-02359

FLOODS CAUSED BY CYCLONE BEULAH (SPANISH).

Ingenieria Hidraulica en Mexico, Vol 22, No 2, pp 203-212, 1968. 10 p, 17 photo, 2 maps.

Descriptors: *Hurricanes, *Tropical cyclones, *Floods, Diversion structures, Watershed management, Flood damage, Flood control, Routing, Hydraulic structures.
Identifiers: *Lower Bravo River Basin, *Cyclone Beulah, *Mexico, Hurricanes.

A summary is given of the report prepared by the special Commission appointed to collect damage data from the Beulah hurricane, especially flood damage to hydraulic structures on the lower San Juan and Bravo Rivers. The freshet peak of the Alamo reached the Bravo River on Sept 22, 1967, with a flow volume of 2,500 cu m/sec. Flow of the San Juan River was regulated by incorporating the excess water at the retention reservoir of the Gomez Dam. A maximum discharge of 4,910 cu m/sec flowed through the spillway. Overflows of the San Juan River produced flooding of the Irrigation District of the Lower San Juan and the town of Camargo. Water diversions at 3 points aided in flood control at Progreso. Water from Progreso reached San Raefael where it was diverted through the relief canals from 900 to 1,000 cu m/sec toward the Culebron retention reservoir. Three cuts to release water were made downstream from San Rafael. The top of the flood continued to Matamoros with a maximum flow volume of only 445 cu m/sec. From experience gained with Beulah, it is considered possible to control similar

floods more effectively with proper utilization of retention reservoirs and controls. Recommendations are made by the Commission for projects to be planned by the International Commission for Limits and Waters. (Llaverias-USGS)

END OF CYCLONE BEULAH, MEXICO (SPANISH),
Jenaro Paz Reyes.
Ingenieria Hidraulica en Mexico, Vol 22, No 2, pp 189-194, 1968. 6 p, 4 graphs, 1 map.

Descriptors: *Hurricanes, *Tropical cyclones, *Flood damage, Flow control, Dams, Precipitation excess, Hydrographs, Texas, Tornadoes, Hydraulic structures, Winds.
Identifiers: *Mexico, *Cyclone Beulah, Rio Grande Basin, Mission Relief Canal, Anzalduas dam.

Cyclone Beulah, classified as the third most destructive hurricane in Texas, passed between Nueon Laredo and the Falcon Dam leaving floods in a wide zone across the Rio Grande basin and adjacent areas in Mexico and Texas in September 1967. In generating 85 tornadoes, it broke all records. The strong winds and tides caused great damage, but the torrential rains were the most devastating aspect of the storm which caused floods in all streams and rivers in Texas, south of San Antonio, and in Mexico, North of Monterrey. Flow volumes varied in the Bravo River (Rio Grande) from 6,225 cu m/sec at Fort Ringgold, Texas, to 400 cu m/sec at the gaging station below Brownsville. Relief basins in Mexico and the United States were used to obtain this reduction. The Mission Relief Canal in the U S helped divert the turbulent waters from the Lower Bravo River. The international Anzalduas Dam was also used to lower the water level and reduce flooding hazards for several cities along the lower reaches of the Rio Grande. (Llaverias-USGS)

THE EFFECT OF REDUCTION IN STREAM FLOW ON INVERTEBRATE DRIFT,
Idaho State Univ., Pocatello, Dept. of Biology.
G. Wayne Minshall, and Parley V. Winger.
Ecology, Vol 49, No 3, Late Spring, 1968. 3 p, 1 tab, 12 ref.

Descriptors: *Streamflow, *Benthic fauna, *Aquatic drift, Streams, Management, Midges, Mayflies, Invertebrates, Idaho, Indicator organisms, Caddisflies, Stoneflies.
Identifiers: Stream management, Experimental design, Targhee National Forest, Stratiomyidae, Limnephilidae, Black flies, Simulium, Baetis, Ameletus, Cinygmula, Ephemerella, Spring Run Creek, Trichoptera, Dugesia, Neothremma, Dixa, Pericoma, Rhyacophila, Nemoura.

Artificial reduction of discharge of Spring Run Creek (Targhee National Forest, Idaho), to 25% of initial depth and to 44-68% of initial velocity, resulted in increases in numbers of benthic invertebrates in the drift. Forms represented included midges (Chironomidae), several genera of mayflies (Baetis, Ameletus, Cinygmula, Ephemerella), black fly larvae (Simulium), and caddisfly larvae (family: Limnephilidae). A noteworthy observation was the appearance in the drift of large numbers of the triclad flatworm Dugesia, a species not commonly found among drift organisms. Exceptions to the trend of increased numbers with reduced flow occurred in only a few taxa. Changes in current velocity and depth in the stream apparently reversed normal avoidance responses by the benthic organisms to light, and, in many instances, they entered the drift in an active and directed manner as a result of their altered behavioral patterns. Author discusses importance of these data for stream management practices and for consideration of experimental design in studying drift.

GEOCHEMICAL STUDY OF GROUND WATERS IN THE MATSUSHIRO AREA--PART 2: CHEMICAL COMPOSITION OF GROUND WATERS,
Kyoto Univ., Kyoto, Japan, Disaster Prevention Research Institute.
Yasushi Kitano, Ryuma Yoshioka, and Setsuo Okuda.
Bull of Disaster Prev Res Inst, Vol 18, Part 1, No 132, pp 49-58, July 1968. 10 p, 7 fig, 8 ref.

Descriptors: *Groundwater, *Water quality, *Water yield, *Springs, *Earthquakes, Landslides, Calcium, Chlorides.
Identifiers: Japan.

A hydrological and chemical study of groundwater in the Matsushiro area, Japan, was made in 1966-1968 to learn the relationships between earthquake activity and groundwater quality and movement. Several large springs started flowing after the 1966 earthquakes. Some later stopped but several are still flowing. Increases in spring discharge do not follow precipitation increases, probably because the spring sources are deep. Calcium and chloride concentrations increase with earthquake activity. Discharge hydrographs of the major springs are included. Concentrations of the major ions are plotted against time. (Knapp-USGS)

GROUND-WATER HYDROLOGY AND GEOLOGY OF THE LOWER GREAT MIAMI RIVER VALLEY OHIO,
U. S. Geologocal Survey.
Andrew M. Spieker.
U S Geol Surv Prof Pop 605-A, pp A1-A37, 1968. 8 fig, 2 plate, 10 tab, 47 ref.

Descriptors: *Groundwater, *Induced infiltration, *Glacial drift, *Ohio, Water pollution, Water yield, Water quality, Water wells, Water level fluctuations, Water sources, Hydrogeology.
Identifiers: Great Miami River, Hamilton (Ohio), Dayton.

The groundwater resources and geology of the Lower Great Miami Valley, Ohio, were studied to determine their adequacy to meet projected population and industrial needs. The valley is one of the most productive sources of groundwater in the U. S. A buried valley averaging 2 mi wide and 150-200 ft deep, filled with permeable sand and gravel Pleistocene outwash, follows the present course of the Great Miami River. The most favorable groundwater development areas are where 150 or more ft of sand and gravel with no clay layers are recharged at rates of 400,000 gpd per acre or more by induced infiltration. Yields may be as high as 3,000 gpm. Sewage return to the stream keeps streamflow high where induced infiltration would otherwise lessen it, and makes possible continued high pumping rates which are limited mainly by increased cost of treating water of deteriorated quality. River discharge at Hamilton exceeds 490 cfs 90% of the time; ample water is available for induced infiltration. Pumpage, mostly near the area's larger cities, totaled 110 mgd in 1964. Most of the groundwater of the area is untapped. Water levels are 30-50 ft below the surface and fluctuate 5-15 ft annually with highs in winter and spring. The groundwater is hard with total dissolved solids of 400-450 mg/1. The river is contaminated by organic and industrial wastes. Groundwater contamination is not yet a problem. (Knapp-USGS)

QUATERNARY AQUIFERS IN THE MISSISSIPPI EMBAYMENT,
U. S. Geological Survey.
E. H. Boswell, E. M. Cushing, and R. L. Hosman.
U S Geol Surv Prof Pop 448-E, pp E1-E15, 1968. 15 p, 8 fig, 2 plate, 5 tab, 60 ref.

Descriptors: *Water resources, *Groundwater, *Aquifers, *Quaternary period, *Gulf Coastal Plain, Mississippi River Basin, Water yield, Water quality, Water utilization, Aquifer characteristics, Water levels, Water level fluctuations.
Identifiers: Mississippi Embayment.

Alluvial deposits of Quaternary age form one of the most productive groundwater reservoirs in an area of about 45,000 sq mi in the Mississippi embayment. Also hydrologically important is the Red River Valley alluvial aquifer in Arkansas, Louisiana, and Texas. The alluvial aquifers are desirable sources of water for irrigation and industry. They are used for public supplies only where an ample supply of water of better quality is not available from deeper aquifers. Water from the alluvial aquifers is generally a hard to very hard calcium bicarbonate or calcium magnesium bicarbonate type containing excessive iron. Water temperature ranges from 59 deg F in the northern part of the embayment to 68 deg F in the southern part. Most industrial and irrigation wells are less than 150 ft deep. Wells yielding 500 gpm or more are common over more than 90% of the Mississippi River alluvial plain, and yields of more than 5,000 gpm have been reported. Water levels are generally less than 20 ft below the land surface. The amount of water stored in the Quaternary deposits is slightly more than 120 trillion gal. Withdrawals in 1965 averaged about 1,430 million gpd. About 85% of this amount was seasonal pumpage for irrigation. Water level declines of 20-30 ft are usual in the areas of large withdrawal but water levels generally recover to near normal each year. (Author)

GROUND WATER IN THE REPUBLICAN RIVER AREA, CLOUD, JEWELL, AND REPUBLIC COUNTIES, KANSAS,
U. S. Geological Survey, Lawrence, Kansas, Water Resources Division.
Stuart W. Fader.
Kans State Geol Surv Bull 188, 27 p, 1968. 14 fig, 4 plate, 3 tab, 23 ref.

Descriptors: *Water resources, *Groundwater, *Kansas, Irrigation, Alluvium, Water wells, Water yield, Water utilization, Saline water, Municipal water, Domestic water, Stock water, Transmissivity, Permeability, Aquifers.
Identifiers: Water availability, Republican River, Cloud County (Kansas), Jewell County (Kansas), Republic County (Kansas).

The groundwater resources of the Republican River area in Cloud, Jewell, and Republic Counties, Kansas, are described. Information is presented on the interrelationship between river and ground waters, the chloride content of the water and its areal pattern, and water-level fluctuations. Because surface water as well as groundwater is used for irrigation in the area, high water levels are found in some irrigated upland areas. In the lower areas, wells in alluvial deposits yield as much as 1,400 gpm. The annual pumpage in the area is about 12,300 acre-ft. Induced recharge from the Republican River is estimated to account for 710 acre-ft. Recharge from precipitation is estimated to be 0.6 in. Losses to evapotranspiration are estimated to be less than 0.2 in. In parts of northern Cloud County, chlorides may make groundwater unfit for irrigation. There is little yearly change in salinity, which is as high as 13,750 ppm in 1 well. Depth to water, contours on the water table, well locations, saturated thickness, and areas of salinity high enough to be dangerous for irrigation are mapped. Permeabilities and transmissibilities were estimated from pumping tests. Hydrographs of observation wells and the Republican River are included. (Knapp-USGS)

PERMEABILITY OF SAND WITH DISPERSED CLAY PARTICLES,
Mississippi State Univ., State College.
Keith H. Denson, Adnan Shindala, and Charles D. Fenn.
Water Resources Res, Vol 4, No 6, pp 1275-1276, Dec 1968. 2 p, 1 fig, 2 tab.

Descriptors: *Permeability, *Sands, *Kalinite, *Montmorillonite, *Laboratory tests.

Experiments on sand containing varying amounts of montmorillonite and kaolinite show that contents of montmorillonite over 3% reduce effective permeability to water by 100% for sands with a grain size distribution with a mean of 0.30 mm and standard deviation of 0.18 mm. Kaolinite over 16% reduces the permeability of similar sands to practically 0. Losses of permeability of the sand samples with clay contents of 0-10% are tabulated. Permeability of the pure sand used is 0.1082 cm/sec. Only 1% montmorillonite is needed to reduce permeability by 82%. (Knapp-USGS)

ELECTRIC-ANALOG STUDIES OF BRINE CONING BENEATH FRESH-WATER WELLS IN THE PUNJAB REGION, WEST PAKISTAN,
U. S. Geological Survey.
G. D. Bennett, M. J. Mundorff, and S. Amjad Hussain.
U S Geol Surv Prof Pop 1608-J, pp J1-J31, 1968. 31 p, 12 fig, 1 plate, 1 tab, 5 ref.

Descriptors: *Saline water-freshwater interfaces, *Saline water intrusion, *Pumping, Water pollution sources, Analog models.
Identifiers: Punjab (West Pakistan), Skimming wells.

A graphical procedure developed to deal with the problem of water coning beneath an oil well was used to study the coning of saline water beneath a fresh-water well with uniform areal recharge. The head distribution employed in this technique was from an analog model for steady-state axisymmetrical flow. Through a technique of successive approximation, the lower boundary of the model was adjusted to simulate the highest stable position of the brine cone in each of 18 different experiments. Flownets were constructed from the analog results for each experiment. The series of experiments represented 6 screen penetrations at each of 3 values of a parameter representing the thickness of fresh water at the radius of influence of the well, the lateral permeability, and the vertical permeability. Dimensionless functions yielding the drawdown and discharge of the well when the brine cone is in its highest stable position were calculated from the results of each experiment. Applied to conditions in the Pinjab Region of West Pakistan, the results indicate that prospects are good for the development of wells capable of yielding fresh water above a stable cone in the underlying brine or brackish water. 2G. Water in Soils

SOIL WATER RECHARGE DURING THE DORMANT PERIOD IN THE NORTHWEST CORN BELT,
Agricultural Research Service, Morris, Minn., North Central Soil Conservation Research Center.
D. R. Timmons, and R. F. Holt.
J Soil and Water Conserv, V 23, No 5, pp 177-180, Sept-Oct 1968. 4 p, 5 fig, 2 tab, 12 ref.

Descriptors: *Recharge, *Soil moisture, *Prairie soils, South Dakota (Minnesota).
Identifiers: Dormant season (Crops), Farming.

Soil water recharge during the dormant period was measured for several crops at 17 locations in western Minnosota and eastern South Dakota during a 3-yr period. The experimental areas were on prairie soils developed on calcareous glacial till or on loess overlying till. Annual precipitation is 21-25 inches, of which 10-12 are available for recharge. Soil watercontent at the beginning of the dormant period is a major factor in determining dormant season recharge. The greatest increase in total soil water generally was in late March and early April when precipitation was rain and wet snow and the soil was thawing. Between freeze and thaw, 49% of precipitation was retained by the soil. Spring recharge was 29% of precipitation, and was lowest where initial soil moisture was highest. (Knapp-USGS)

DETERMINATION OF HYDRAULIC CONDUCTIVITY AS A FUNCTION OF DEPTH AND WATER CONTENT FOR SOIL IN SITU,
CSIRO, Canberra, Div. Land Res. and Reg. Surv., and Australian Nat. Univ. School of General Studies, Dept. of Math.
C. W. Rose, W. R. Stern, and J. E. Drummond.
Australian J Soil Res, Vol 3, No 1, pp 1-9, July 1965. 9 p, 4 fig, 19 ref.

Descriptors: *Hydraulic conductivity, *Moisture content, Radiation, *Saturated soils, *Soil profiles, *Depth, Soil moisture, Soil water movement, Overburden, Measurement, Hysteresis, Equations, Temperature.
Identifiers: In situ soil, Unsaturated soils, Suction, Vapor.

The paper shows how hydraulic conductivity may be determined in the field over the entire range of water contents on a soil of non-uniform profile. A theory is presented to calculate hydraulic conductivity as a function of depth and successive measurements of water content profiles for soils in situ. With unsaturated soil, potential gradients are inferred using moisture characteristics. With saturated soil potential gradients must be measured directly. Correction due to the overburden effect should be checked whenever in situ soil water suction is inferred from water content via soil moisture characteristics. A possible limitation to the method, particularly if radiation is intense such as in arid climate, might be the effect of daily temperature waves on water redistribution in either liquid or vapor phase. This effect will usually be restricted to the top 20 cm. of the soil profile. (Blecker-Ariz)

WATER MOVEMENT ABOVE SHALLOW WATER TABLES IN SOUTHERN ALBERTA,
Canada Department of Agric., Lethbridge, Alberta, Research Station.
J. C. Van Schaik, and D. S. Stevenson.
J Hydrol - Amsterdam, Vol 5, No 2, pp 179-186, 1967. 8 pp, 1 fig, 2 tab.

Descriptors: *Water table, *Soil surfaces, *Evaporation, *Saline soils, Soil moisture, *Soil water movement, Groundwater, Arid lands, Rainfall, Precipitation intensity, Lysimeters, Soil temperature, Water loss, Siphons, Clay loam, Water balance, Seasonal.
Identifiers: *Salt accumulation, Alberta (Canada).

Water movement was measured under bare soil with a shallow water table (3-5 feet from the surface) in southern Alberta. Where rainfall from June 1 to November totaled 15 cm. or more, a net downward movement of water could be expected under bare clay loam if the water table was at a depth greater than 1 meter. A net annual upward movement could be expected when the water table is at a depth of less than 1 meter. Under these circumstances water migration during the winter and subsequent evaporation in the spring could add to the salt accumulation at the soil surface. Results indicated that the low evaporation from the water supplied by the groundwater explained the lack of salt accumulation at the soil surface at the study site. The soil and climate conditions that were studied are common in the arid parts of the world. (Blecker-Ariz)

LIBRARY U. OF I. URBANA

Identifiers: *Soil columns.

The adsorption of sodium from saline water during flow through chromatographic columns was studied utilizing four soil types from Texas having different soil mineralogy texture and cation exchange capacity. Eight synthetic and two natural well waters were used to leach the soils. It was concluded that the relationship between SAR and ESP of soil did not give a significant correlation when sodium containing water flowed through soil columns. The exception was the surace of the soil. The total electrolyte concentration of the sodic water influenced the rate of sodium adsorption. At equilibrium soil mineralogy and the cationic composition exerted a greater influence over the exchangeable sodium percentages. Mica and montmorillonitic soils had a greater affinity for Na than did montmorillonitic soils. Flow of water in field conditions from equilibrium hydraulic conductivity could not be determined. QUALITY OF WATER AND STRATIFICATION OF POSSUM KINGDOM, WHITNEY, HUBBARD CREEK, PROCTOR AND BELTON RESERVOIRS,
Texas Water Development Board, Austin.
Donald K. Leifeste, and Barney Popkin.
Tex Water Develop Board Rep 85, 116 p, Oct 1968. 16 fig, 5 tab, 18 ref.

Descriptors: *Chemical stratification, *Density stratification, *Reservoirs, *Texas, Limnology, Chlorides, Dissolved solids, Water quality, Water temperature.
Identifiers: Brazos River Basin (Texas).

The chemical quality and stratification of Possum Kingdom, Whitney, Hubbard Creek, Proctor, and Belton Reservoirs, Texas, were studied between Sept 1961 and May 1965. The water in Possum Kingdom Reservoir generally contains between 1,050 and 1,600 ppm dissolved solids. Inflow varies considerably in salinity and is seldom similar to the water in storage. The low-flow of winter brings highly-saline water to the reservoir; the higher flows of spring usually are of much better quality. The reservoir is seasonally thermally stratified and because salinity is seasonally variable with highest values at winter low flow, the chemical stratification parallels the seasonal thermal stratification. The water in Whitney Reservoir generally contains 650 and 1,200 ppm dissolved solids. About 2/3 of the inflow is water released from Possum Kingdom Reservoir. Seasonal stratification patterns usually develop only during the winter months when local runoff is small and inflow consists mostly of releases from Possum Kingdom Reservoir. The water quality in Hubbard Creek, Proctor, and Belton reservoirs is good; generally total dissolved solids are below 500 ppm. Stratification occurs only with storm runoff in Hubbard Creek Reservoir and is usually of short duration. (Knapp-USGS)

CHLOROPHYLL DERIVATIVES IN SURFACE MUDS FROM THE ENGLISH LAKES,
Toronto Univ., Ontario, Canada, Dept. of Botany.
Eville Gorham.
Limnol Oceanogr, Vol 5, pp 29-33, 1960. 5 p, 2 fig, 2 tab, 7 ref.

Descriptors: *Plant pigments, *Sediment-water interfaces, *Eutrophication, *Diagenesis, Chlorophyll, Mud, Diatoms, Sedimentation, Nutrients, Oligotrophy, Limnology, Lakes, Potash, Carbon, Carbon cycle, Lime, Phytoplankton, Water pollution effects, Water pollution sources, Spectrophotometry.
Identifiers: *Chlorophyll derivatives, Pheophytin, Melosira, English Lake District, England, Wastwater, Ennerdale Water, Windermere North Basin, Esthwaite Water, Priest Pot.

Chlorophyll derivatives, total carbon, and total sulfur were estimated in surface muds from five widely differing bodies of water of the English Lake District (Wastwater, Ennerdale Water, Windermere North Basin, Esthwaite Water, Priest Pot). All three components increased in the muds of these lakes, which varied from large infertile types, low in phytoplankton and poor in lime and potash, to smaller lakes with large phytoplankton crops and more plentiful lime and potash. Carbon, expressed as percentage dry weight of mud, varied from 6.6 (Ennerdale Water) to 18.9 (Priest Pot); sulfur, similarly expressed, from 0.18 (Wastwater) to 1.22 (Priest Pot). Chlorophyll derivatives, in arbitrary units per gram of dry weight, varied between 0.21 (Wastwater) and 6.88 (Priest Pot). Ratios at particular wavelengths (410/350 millimicrons) of optical densities of acetone extracts of mud may be related to balance between autochthonous and allochthonous organic matter and to length of time they spend in an oxidizing atmosphere. That ratio for Wastwater (0.7) indicates that chlorophyll derivatives from terrestrial sources may be more important there than in Priest Pot (1.8). Author suggests that concentration of chlorophyll derivatives in mud may be more sensitive as an indicator of lake fertility than concentration of carbon or sulfur.

PHOSPHORUS UTILIZATION BY ASTERIONELLA FORMOSA,
Ferry House, Far Sawrey, Ambleside, Westmorland, England.
F. J. Mackereth.
J Exp Botany, Vol 4, No 12, pp 296-313, Sept 1953. 18 p, 9 fig, 6 tab, 20 ref.

Descriptors: *Diatoms, *Phosphorus compounds, *Water pollution effects, *Plant growth, Lakes, Growth rates, Population, Productivity, Algae, Cultures, Environmental effects, Nutrients, Cycling nutrients, Essential nutrients, Eutrophication, Nutrient requirements, Phytoplankton.
Identifiers: Lake Windermere, Asterionella, England.

Studies, in Lake Windermere (England), of the relationship of growth of the diatom Asterionella formosa to concentrations of dissolved phosphate occurring there and studies of phosphorus requirements for growth by that organism in culture indicate that it can take up and store reserve phosphorus from concentrations (below 1 microgram per liter) found in phosphorus-poor lakes. Population growth of diatoms continues in phosphorus-deficient media at the expense of cellular phosphorus. Limiting requirements of phosphorus per cell are minute (about 0.06 microgram per million cells). Culture experiments indicate that initial concentrations as low as 1.0 micrograms phosphorus per liter theoretically can produce some 16 million cells per liter. Growth of this diatom in nature conforms to that in culture. Author concludes that very low initial concentrations of dissolved phosphate in Windermere probably do not limit population growth of Asterionella. Cells of this species, low in phosphorus, rapidly take up added phosphorus from lake water but not from distilled water. The unknown factor in lake water, which influences phosphate uptake by depleted cells, appears to be heat labile and dependent upon pH.

2I. Water in Plants

THE INTERCEPTION-TRANSPIRATION RELATIONSHIP OF WHITE SPRUCE AND WHITE PINE,
Minn. Univ., St. Paul, School of Forestry, and Ariz. Univ., Tucson, Dept. of Watershed Management.
J. A. Nicolson, D. B. Thorud, and E. I. Sucoff.
J Soil and Water Conservation, V 23, No 5, pp 181-184, Sept-Oct 1968. 4 p, 1 fig, 3 tab, 10 ref.

Descriptors: *Interception, *White pine trees, *Laboratory tests, *Evapotranspiration, Transpiration, Evaporation, Energy budget.
Identifiers: White spruce trees.

Interception was studied by planting 8 white spruce and 8 white pine trees, all about 3 ft high, about 6 f apart in pots in a 200 by 600 ft clearing in a fores of oak trees. Relative humidity, air temperature net radiation, evaporation, and wind velocity were measured. The trees were weighed dry to deter mine transpiration and weighed after wetting t determine interception. A relationship was deter mined between transpiration of the wetted tree and the control or unwetted group. Wetted whit spruce transpired 53 gm or 17% less than unwette trees. This was only 13% of the 405 gm of inter cepted water; 87% of the intercepted wate evaporated without affecting transpiration. Fo wetted white pine, transpiration was 42 gm or 14 less than for unwetted trees. This was 12% of th 371 gm of intercepted water. The percentage wate saved in white pine decreased as the number o wettings increased. There was no such trend i white spruce. The experimental data are tabulate (Knapp-USGS)

COMPARISON OF WATER POTENTIALS I LEAVES AS MEASURED BY TWO TYPES O THERMOCOUPLE PSYCHROMETER,
CSIRO, Griffith, N.S.W., Australia, Irrigatio Research Laboratory.
H. D. Barrs.
Australian J Biol Sci, Vol 18, No 1, pp 36-5 February 1965. 17 pp, 10 fig, 2 tab.

Descriptors: *Instrumentation, *Leave *Hygrometry, Heat, *Vapor pressure, Respiratio Anaerobic conditions, Aerobic conditions, Coo ing, Calibrations, Temperature, Oxygen, *Plant ti sues, Plant physiology, Metabolism, Measuremer Moisture stress.
Identifiers: *Thermocouple psychrometer, *Wat potential, Dry bulb temperature, Wet bulb te perature.

Two types of thermocouple psychrometers we compared with respect to the measuring of wat potentials in leaves. Significant differences we observed between the Spanner and the Richar and Ogata psychrometers. Differences were caus by liberation of heat accompanying aerob respiration by the tissue which raised the chamb temperature above that of the controlled wat bath in which the chamber was immersed. The t psychrometers agreed closely owing to preventi of temperature rise within the vapor pressu equilibration chambers that contained leaf mate al. This was done by attaching the leaf to a he sink in the chamber. The Spanner psychrome was found to be preferable to that of Richa when working with plant material since it takes i account the departure of chamber temperatu from bath temperature caused by metabolic acti ty, whereas a single Richards psychrometer co not. The thermocouple psychrometer could used in arid climates to measure water potentials

leaves and to indicate moisture stress in plants. (Blecker-Ariz)

CONTROL OF LEAF STOMATA--THEIR ROLE IN TRANSPIRATION AND PHOTOSYNTHESIS,
Israel Zelitch.
American Scientist, Vol 55, No 4, pp 472-486, 1967. 15 pp, 3 fig, 5 tab, 35 ref.

Descriptors: *Stomata, *Transpiration control, Photosynthesis, *Water vapor, *Water conservation, Hydrologic cycle, Leaves, Biochemistry, Diffusion, Plant physiology, Carbon dioxide.

Experiments concerned with the mechanism of stomatal opening and closing were described and the consequences of the biochemical control of stomatal opening on the processes of photosynthesis and transpiration were discussed. Water vapor escaping from the leaf has a shorter path length of diffusion since intercellular spaces within the leaf at the evaporating surface of the mesophyll cells are already saturated with water vapor. Narrowing of stomata in isolated leaves or plants in the laboratory decreases transpiration. Stomatal diffusive resistance is a significant factor in water conservation and control of their width may provide a strategic and rational means of achieving changes of scope in the hydrologic cycle in arid climates. (Blecker-Ariz)

RESISTANCE TO GAS FLOW THROUGH THE LEAF AND ITS SIGNIFICANCE TO MEASUREMENTS MADE WITH VISCOUS FLOW AND DIFFUSION POROMETERS,
Hebrew Univ of Jerusalem, Dept. of Botany.
J. Gale, and Alexandra Poljakoff-Mayber.
Israel J Bot, Vol 16, No 4, pp 205-211, 1967. 7 p, 2 fig.

Descriptors: *Resistance, *Gases, *Flow measurement, *Leaves, Measurement, Viscous flow, Pores, Diffusion, *Water vapor, Vapor pressure, Stomata, Boundary layers, Surfaces.
Identifiers: Gas flow, *Porometers, Vapor exchange, Air vapor, Air vapor density gradient.

Resistance to viscous flow of air through the leaf and resistance to diffusion of water vapor out of the two leaf surfaces were measured simultaneously while environmental conditions were varied in bean and maize leaves. The leaves were subjected to increasing degrees of leaf to air vapour deficit while still attached to well watered plants. The result of this treatment was an increase in resistance to viscous flow which was not paralleled by an increase in diffusion resistance for both species. It was concluded that porometers based on the passage of gas through the leaf may give highly erroneous estimates of leaf resistances to gas and vapour exchange. (Affleck-Ariz)

Plant and Soil, Vol 29, No 1, pp 119-131, Aug 1968. 13 p, 3 fig, 3 tab.

Descriptors: *Range grasses, Osmotic pressure, Moisture availability, *Plant growth, Soil moisture, Soil-water-plant relationships, Xerophytes, Wilting point, *Water requirements, *Transpiration, Deserts, *Drought resistance, Arid lands.
Identifiers: Sap, United Arab Republic.

A study of the growth, water requirements and drought resistance of five introduced and five native range plants was conducted at the Ras El-Hikma Range Research Station of the United Arab Republic. Growth aspects, transpiration rate, and sap osmotic pressure were determined at different levels of available soil moisture from permanent wilting to the moisture equivalent. The transpiration intensity of all the studied species was low and comparable with that of xerophytes living under extremely dry conditions. Most vigorous vegetative growth and highest dry matter production were shown by Chloris gayana. It was concluded that Chloris gayana was the most suitable species for cultivation in desert regions. MOLYBDENUM AS A FACTOR LIMITING PRIMARY PRODUCTIVITY IN CASTLE LAKE, CALIFORNIA,
California Univ., Davis, Dept. of Zoology.
Charles R. Goldman.
Science, Vol 132, p 1017, 1960. 2 p, 1 fig, 9 ref.

Descriptors: *Molybdenum, *Primary productivity, *Bioassay, California, Carbon radioisotopes, Photosynthesis, Nitrogen fixation, Trace elements, Lakes, Chlovella, Scenedesmus, Cirques.
Identifiers: *Castle Lake (Calif.), Alder trees, Alnus.

Enrichment with molybdic acid or sodium molybdate of waters of Castle Lake, California, a cirque lake with restricted watershed, stimulates the rate of carbon-14 uptake by resident populations of phytoplankton both in situ and in the laboratory. Addition of molybdenum in optimum concentrations of 0.025 ppm showed qualitatively similar results throughout the year. In a typical experiment, addition of 0.10 ppm molybdenum resulted in uptake of carbon-14 (expressed as counts per minute) approximately three times greater than in unenriched controls after four days incubation. Author suggests that trace element deficiencies may be characteristic of lakes with limited watersheds. He also suggests that the effect of molybdenum deficiency in this lake is mediated via nitrogen reductase in the nitrogen fixation-reduction system and that heavy growth along the shores of alder--a nitrogen-fixing species--competes with the lake for available molybdenum.

ON THE CHANGE IN SALINITY DISTRIBUTION AND BOTTOM TOPOGRAPHY AFTER THE CLOSING OF THE MOUTH OF KOJIMA BAY,
Kyoto Univ., Kyoto, Japan, Disaster Prevention Research Institute.
Setsuo Okuda.
Bull of Disaster Prev, Res Inst, Vol 18, Part 1, No 133, pp 35-48, July 1968. 14 p, 9 fig, 2 tab, 5 ref.

Descriptors: *Estuaries, *Reservoirs, *Salinity, *Saline water-freshwater interfaces, *Salt balance, Topography, Saline water intrusion, Winds, Mixing.
Identifiers: Polders (Japan).

The effects of closing of Kojima Bay, an estuary in southern Okayama Prefecture, Japan, to make a fresh-water reservoir, were studied. The salinity distribution, flow pattern, and topography of the bottom were changed. In the rivers entering the reservoir, salinity increase is approximately linear downstream. In the lake, there is a stable horizontal interface between inflowing river water and lower salt water. The position of the interface varies with riverflow, irrigation pumping, and intrusion of sea water when the gates are open. The change with gate opening averages 20-40 cm. Winds cause mixing which blurs the interface and strong drift currents which tilt it. The salt balance effect of river inflow and outflow, polder drainage, and seawater intrusion was calculated and the results are tabulated. (Knapp-USGS)

COOPER RIVER, SOUTH CAROLINA (SHOALING IN CHARLESTON HARBOR).
Corps. of Engineers, Washington, D. C.

U S 90th Congr, 2d Sess, Senate Doc No 88, 206 p, 1968. 3 fig, 5 plate, 5 tab, 1 suppl, 1 append.

Descriptors: *Harbors, *Sedimentation, *Density currents, Salinity, Canals, Model studies, Hydroelectric power, South Carolina.
Identifiers: Santee River, Cooper River, Charleston Harbor.

Study of the shoaling of Charleston Harbor, South Carolina, showed that shoaling increased soon after diversion of water by a hydroelectric power project from the Santee River into Cooper River and Charleston Harbor in 1942. The investigation, which included model tests, proved that the diversion caused the shoaling by interaction of increased fresh water discharge with salty harbor water and formation of bottom density currents, predominantly upstream, which prevent settled sediment from being flushed out to sea. The best remedial plan is to redivert the Santee River water back to the Santee River through a canal. A powerplant of 84,000 Kw is proposed for the canal. The existing plant would be operated at a reduced output. Total power would be increased, while discharge to the harbor would be greatly reduced. Cost is estimated to be $35,381,000. The benefit-cost ratio is estimated to be 2.17 for 50-year amortization, and for 100-year amortization, 2.73. (Knapp-USGS)

Descriptors: *Mathematical models, *Estuaries, *Saline water intrusion, *Tides, Currents (Water), Digital computers, Tracers, Dye releases, Dispersion, Path of pollutants.
Identifiers: Finite-difference methods, Potomac River.

A one-dimensional mathematical model is developed which describes the longitudinal concentration distribution of a pollutant in an estuary. The importance of including the tidal velocity in the advective term of the mass balance equation is emphasized. The cross-sectional area, the tidal and fresh water velocities and the longitudinal dispersion coefficient may all be functions of distance and time. The unsteady equation for the concentration distribution is solved by an implicit, finite-difference technique on a digital computer. The difference in the magnitude of the longitudinal dispersion coefficient, E, in the salinity intrusion region and in the fresh water tidal portion is described. A modification of Taylor's dispersion equation is presented for the determination of E in the fresh water tidal portion of an estuary. The mathematical model is applied to the upper portion of the Potomac estuary and the results are compared with field observations for a 13-day period in which dye was injected into the estuary. The predicted concentration distributions are in reasonable agreement with the measured values. The magnitude of E is of the order of 0.1 sq mile per day. The importance of nonlinear tidal motion effects is described in relation to the distribution of pollutants in estuaries. (Author)

WATER SUPPLIES AND SEWAGE DISPOSAL IN BERLIN,
K. Huhnerberg.
Gas Wasserfach, Vol 104, pp 1203-1213, 1963.

Descriptors: *Sewage treatment, *Storm runoff, *Overflow, Sedimentation.
Identifiers: *Combined sewers, Capacity, Berlin (Germany).

A detailed illustrated description is given of the sources and treatment of water supply and of sewage disposal in the area of West Berlin from the Elbe-Saale to the Oder and Neisse. Increased demands due to industrial development have necessitated extensions and reconstructions of existing water works and construction of new water works and sewage-treatment plants. The performance of the various water works is tabulated. Finally, the author discusses the advantages of combined over separate sewerage systems and the design and dimensions of sedimentation tanks and storm-water overflows.

TRENDS IN RESERVOIR CAPACITY AND USE,
U. S. Geological Survey, Washington, D. C.
W. B. Langbein.
Ind Water Eng, Vol 5, No 10, pp 30-31, Oct 1968. 2 p, 2 fig.

Descriptors: *Reservoirs, *Water users, Multiple-purpose reservoirs, Conservation, Dams, Irrigation water, Recreation, Municipal water, Industrial water, Hydroelectric power, Flood control.
Identifiers: Reservoir capacity, Water-use study.

The recent history of dam and reservoir construction and use in the U S is reviewed. There are over 1,600 reservoirs larger than 5,000 acre-ft. The growth in total reservoir capacity has been a steady 80% per decade since 1900, contrasting with a 40% increase in total water use and a 20% population growth. There have been significant changes in reservoir use. In 1900, most reservoirs were for municipal supply and power generation purposes. With passage of Federal Reclamation laws in 1902, irrigation storage increased and became the largest component of reservoir capacity in the 1920's. The flood control acts of 1936 and 1938 expanded that use until now it exceeds irrigation. The present rank is power first, flood control second, irrigation third and water supply fourth. Since the 1930's, there has been great emphasis on multiple-use reservoir size, from 60,000 acre-ft before 1933 to 370,000 acre-ft after 1950. The trend toward larger reservoirs probably will decline as most large sites are used, but reservoirs will remain an important part of American water management. (Knapp-USGS)

THE MECHANISM OF SALT TOLERANCE IN SUAEDA FRUTICOSA AND HALOXYLON RECURVUM,
Karachi Univ, Karachi, West Pakistan, Botany Dept.
Rafiq Ahmad.
Plant and Soil, Vol 28, No 2, pp 357-362. Apr 1968. 7 p, 2 tab.

Descriptors: *Halophytes, *Plant physiology, Salinity, Saline soils, *Salt tolerance, Alkaline soils, Toxicity, Cytological studies, Cation exchange, Sampling, Soil chemistry, Granules, X-ray spectroscopy, Irrigation effects.

Physiology of salt tolerance in plants has the attention of plant scientists because salinity and alkalinity are taking over large areas of irrigated land all over the world. A study was conducted in West Pakistan using Suaeda fruiticosa and Haloxylon recurvum to determine how the harmful effects of excess salts are offset within the plant. Free hand sections of their leaf and stem revealed the presence of intracellular granular structures in various regions of the hypodermis, cortex and pith. On analysis they were found to contain salts of Na, K, Ca, and Mg impregnated with some quartz particle which rendered them insoluble to water. It was concluded that the cells worked merely as storehouses and did not let the mineral interfere in the normal metabolism of the plant. This was considered as one of the adoptive mechanisms for inducing salt tolerance in the halophytes. (Affleck-Ariz)

EFFECT OF SOIL SALINITY ON EXTERNAL MORPHOLOGY OF COTTON LEAVES,
Agricultural Research Service, Weslaco, Texas.
Harold W. Gausman, and Ruben Cardenas.
Agron J, Vol 60, No 5, pp 566-567, Sept-Oct 1968. 2 p, 3 tab.

Descriptors: *Saline soils, *Plant morphology, *Leaves, Epidermis, Cytological studies, *Cotton, Plant growth, Plant physiology, *Remote sensing, Sampling, Stomata, Texas, Microscopy, Loam.
Identifiers: Leaf thickness, Rio Grande Valley, Photomicroscopy.

A study on the external morphology of leaves from cotton grown in areas of low and high soil salinity was conducted at Weslaco, Texas, in the Rio Grande Valley. The fourth leaf from the apex of each cotton plant was sampled and the thickness of each leaf was measured. Also counts on the number of stomata and epidermal cells, and measurements on their size were made. Microscopic examination revealed that high salinity caused fewer epidermal cells and stomata per unit area, increased surface size of epidermal cells, and increased leaf thickness. (Affleck-Ariz)

SODIUM HAZARD OF IRRIGATION WATERS AS INFLUENCED BY LEACHING FRACTION

AND BY PRECIPITATION OR SOLUTION OF CALCIUM CARBONATE,
Salinity Laboratory, Riverside, Calif.
C. A. Bower, G. Ogata, and J. M. Tucker.
Soil Sci, Vol 106, No 1, pp 29-34, July 1968. 6 p, 4 fig, 5 tab.

Descriptors: *Sodium, *Irrigation water, *Leaching, *Chemical precipitation, *Calcium carbonate, Hydrogen ion concentration, Lysimeters, Alfalfa, Salinity, Loam, Adsorption, Cation exchange, Drainage water, Calcium, Magnesium.
Identifiers: Leaching fraction, Steady state values.

Calcareous Pachappa sandy loam in lysimeters growing alfalfa was irrigated with six waters having variable Na/ (Ca + Mg) and HCO3/ (Cl = SO4) ratios at leaching fractions of .1, .2, .3, and .4, until the sodium adsorption ratio of the drainage water became constant. Increased leaching repressed precipitation of CaCO3 from the waters and enhanced solution of CaCO3 from the soil. At any leaching fraction the amount and fraction of applied HCO3 that precipitated as CaCO3 from the water or the amount of CaCO3 that dissolved from the soil was highly related to a calculated pH value of the water which was dependant primarily upon the Ca, Mg, and HCO3 concentrations of the water. When the sodium-adsorption ratio of the drainage waters from the lysimeters had become constant, the salt and exchangeable Na that had accumulated in the soil increased with depth. (Affleck-Ariz)

EFFECT OF SALINITY AND WATER SUPPLY ON OLIVE,
Cairo Univ, Cairo, UAR, Dept of Botany.
A. A. Abd El-Rahman, and M. H. Sharkawi.
Plant and Soil, Vol 28, No 2, pp 280-290, Apr 1968. 11 p, 6 fig.

Descriptors: *Salinity, *Osmotic pressure, *Salt tolerance, Soil moisture, Soil-water-plant relationships, Absorption, Plant growth, *Transpiration, Arid lands, *Irrigation water, Wilting point, Deserts, On-site investigations, Leaves, Moisture availability, Groundwater.
Identifiers: Olive trees, Sap, Egypt.

An investigation was conducted at Burg El Arab, Egypt, aimed at extending the areas of the desert planted with olive as much as possible with the limited amount of water available in the desert region and to make use of saline underground water. Therefore a study was conducted to find out the highest salinity of the underground water that could be tolerated by the young developing plants and how much salinity controls water uptake. Also the effects of water supply were studied to determine the lowest moisture level required for the growth of the young plants, and to avoid the use of excess water. Young olive plants failed to grow when irrigated with water having an osmotic pressure of 25 atm. or higher. The successful growth of young plants irrigated with water having an osmotic pressure of 15 and 20 atm. indicated that young olive plants could be irrigated with underground water whatever its salinity provided that subsurface irrigation was applied to avoid capillary rise and accumulation of salts on the surface. 3D. Conservation in Domestic and Municipal Use

METROPOLITAN WATER SUPPLY AND UTILIZATION.

Mass Ann Laws, Ch 92, Secs 16-19 (1966).

Descriptors: *Massachusetts, *Cities, *Water utilization, *Water supply, Legislation, Domestic water, Water districts, Water rates, Adjudication procedure, Environmental sanitation, Diversion, Administrative agencies, Regulation, Judicial decisions, Compensation, Fishing, Fouling, Wastewater (Pollution), Public utilities.
Identifiers: Abandoned waters.

Section 16 provides that no town, except Hingham and Hull, within ten miles of the state house, nor any water company in such town, shall, except in case of emergency, use for domestic purposes water from any source not now used by it except as provided in Chapter 92. Compensation for the taking of any water company in such town shall not be affected by Chapter 92. The section provides the procedure before the Supreme Judicial Court for setting water rates for Hingham and Hull. Section 17 empowers the Department of Public Health to make rules and regulations for the sanitary protection of such waters. The rules must be posted and published in a newspaper to give sufficient notice. The certificate of any member of the commission of such posting and publication shall be prima facie evidence thereof. Any of such waters abandoned as a water supply shall be open for fishing purposes. Section 18 is a general prohibition against diversion, pollution, and waste of the water supply of any town in the metropolitan water district. Section 19 specifies the classes of persons to which Section 18 is not applicable. (Smodish-Fla)

NATIONAL PLAN TO SUPPLY DRINKING WATER TO URBAN DISTRICTS, 1966-1970. (SPANISH).

Ingenieria Hidraulica en Mexico, Vol 22, No 2, pp 214-232, 1968. 19 p, 5 tab, 12 photo, 1 fig, 1 chart, append.

Descriptors: *Potable water, *Water distribution (Applied), *Urban sociology, Water resources development, Capital costs, Priorities, Water policy, Project purposes, Urbanization.
Identifiers: *Mexico, *National water-supply plan, Water management plan, Urban planning.

A National Plan to Supply Drinking Water to urban districts in Mexico is described as it was presented before the 7th National Congress of Civil Engineers, Guadalajara, in November 1967. The plan is an integral part of the national investment policy and calls for specific action on the part of private enterprise in cooperation with the Federal Government. Ultimate objective is auto-sufficiency for the water systems, both economically and administratively. The goal set is to enlarge and improve existing systems and initiate required new works. Priority will be given to cities that offer greater expansion possibilities, such as State capitals, seaports, tourist towns, and industrial centers. The intention is to benefit the 1,500 urban districts that are widely distributed and would serve 70% of the urban people by 1970. Only 48% had adequate water facilities in 1966. The plan calls for an investment totaling 2,000 million pesos. Administrative and legal aspects of the plan are carefully analyzed. (Lang-USGS)

STRUCTURAL ALTERATION OF SOIL SURFACES BY TILLAGE AND RAINFALL,
Agricultural Research Service, Morris, Minnesota.
R. E. Burwell, R. R. Allmaras, and L. L. Sloneker.

J Soil and Water Cons, Vol 21, No 2, pp 61-63, March-April 1966. 3 pp, 2 fig, 2 tab.

Descriptors: Soil management, *Soil surfaces, *Infiltration, *Runoff, Water conservation, Erosion control, *Porosity, *Rainfall, Cultivation, Slopes, Soil structure, Loam, Pores, Rainfall-runoff relationships, Soil texture, Soil moisture, Moisture content.
Identifiers: Roughness.

The article discussed interrelation of rainfall with various tillage methods and advantages of each combination as a means of conserving water and combating erosion. Tillage methods used in the study were: untilled, plow, plow-disk-harrow, cultivated and rotovated. Rainfall was artificially applied to loam soil at the rate of 5 inches per hour to each of the freshly tilled surfaces. Rainfall decreased random roughness and total pore space of freshly tilled soil. Most of the decrease occurred during the period before initial runoff. Pore space modified the effectiveness of random roughness for delaying initial runoff. A large pore space alone did not delay initial runoff. A large initial runoff was modified by tillage practices. Cumulative infiltrations were significantly affected by all tillage treatments, but only in the case of rough surfaces was infiltration prior to initial runoff significantly greater than the cumulative infiltration which occurred following initial runoff. (Blecker-Ariz)

AN APPARATUS FOR MEASURING WATER POTENTIALS IN THE XYLEM OF INTACT PLANTS,
CSIRO, Griffith, N S W, Australia, Irrig. Res. Lab.
A. R. G. Lang, and H. D. Barrs.
Australian J Biol Sci, Vol 18, No 3, pp 487-497, June 1965. 1 pp, 5 fig, 4 tab.

Descriptors: Plant physiology, Hygrometry, *Xylem, *Temperature, Water vapor, *Vapor pressure, Moisture uptake, Instrumentation, Leaves, *Measurement, Energy budget, Calibrations, Equilibrium.
Identifiers: Thermocouple psychrometer, *Water potential, *Intact plants, Stem.

This paper described a new method and apparatus for estimating water potentials in the xylem of a plant. The method is based on the fact that energy of water in the vapor phase in equilibrium with the attached leaf gives a measure of the energy of water in the conducting elements of the stem xylem. Constant temperature of the leaf-vapor system was a critical requirement for the technique. The apparatus was based on the thermocouple psychrometer. Illustrative experiments were described in which continuous records of the estimated water potential in the xylem of cotton and pepper plants were given for periods of up to 10 hours. The method can, in principle, be applied to all plants in an arid climate which have suitable long petioles and broad leaves. (Blecker-Ariz)

THE CLIMATE OF THE COTTON CROP: PHYSICAL CHARACTERISTICS AND MICROCLIMATE RELATIONSHIPS,
Volcani Institutue of Agricultural Research, Rehovoth, Israel.
G. Stanhill, and M. Fuchs.
Agricultural Meteorology, Vol 5, No 3, pp 183-202. May 1968. 20 p, 9 fig, 5 tab.

Descriptors: *Cotton, *Climatic data, *Irrigation effects, Humidity, *Microclimatology, Air temperature, Growth stages, Semiarid climates, Energy budget, *Crop response, Vapor pressure, Wind velocity, Albedo, Water loss, Hygrometry, Soil temperature, Anemometers, Solar radiation, Heat.
Identifiers: *Aerodynamics, *Energy balance, Israel, Solar elevation, Physical characteristics, Heat storage.

A study of the radiative and aerodynamic characteristics of two irrigated cotton crops was made in a semi-arid zone of Israel. Some of the physical characteristics of the irrigated cotton crop of importance in the modification of the crop microclimate were studied and the relationship between the climate over the crop and that measured at an adjacent open site were determined. Air temperature was always less and humidity greater at the irrigated crop than over the bare soil. Results obtained were compared with those previously reported in the literature for this crop in order to see to what extent they may be considered as being of general application. Microclimate is a factor of great importance in determining yield and water loss from agricultural crops. (Affleck-Ariz)
W69-02394

EFFECT OF IRRIGATION TREATMENTS ON ALFALFA (MEDICAGO SATIVA L.) PRODUCTION, PERSISTENCE, AND SOIL SALINITY IN SOUTHERN CALIFORNIA,
Imperial Valley Field Station, El Centro, Calif. and Calif. Univ, Riverside.
W. F. Lehman, S. J. Richards, and D. C. Erwin.
Hilgardia, Vol 39, No 9, pp 277-295. June 1968. 19 p, 8 fig, 6 tab.

Descriptors: *Alfalfa, *Irrigation effects, *Rates of application, California, *Crop response, Saline soils, *Salt tolerance, Soil-water-plant relationships, Tensiometers, Arid lands, Sampling, Leaching, Root zone, Diseases, Grasses, Winter, Percolation.
Identifiers: Imperial Valley (California).

In the Imperial Valley of Southern California two experiments were conducted to study effects of irrigation management on alfalfa yield, stand persistence, and soil salinity levels in the root zone. Irrigation treatments were based on frequency as determined by tensiometers and on duration of irrigation. In experiment I, where the soil was clay and clay loam, frequent short irrigation or moderate treatment was superior to normal short and frequent long irrigation treatments in yield, stand persistence, and hay quality. In experiment II where the soil was silty clay loam on top of sandy clay, yield was similar for all treatments, but an invasion of grass resulting from weaker stands reduced the quality of the hay produced in the frequent long treatment. Disease incidence was higher in the wet than the dry treatments. Soil salinity was inversely related to hours of applied irrigation in both experiments. (Affleck-Ariz)

04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on THE Surface

KISTLER V WATSON (IMPROPER RESTRICTION OF STREAM FLOW).

156 A 2d 833-836 (Ct App Ohio 1959).

Descriptors: *Ohio, Civil law, Judicial decisions, Natural flow doctrine, Watercourses, *Dams, Riparian rights, Alteration of flow, Diversion, Reasonable use, Impounded waters, Farm ponds, Flow, Average flow, Natural flow, *Flow rates, Obstruction to flow.

A natural watercourse flowed across defendant's property and then across plaintiff's land. This spring ran for over fifty years until defendant constructed a dam to create a pool of water on his property. There was evidence that the stream was dry for the first time after the constuction of the dam. The court held that a riparian owner such as the defendant had a legal right to impound the water to create a pond provided he permited water to reach the land of the lower riparian owner in a substantially normal flow. Finding that the dam had materially affected the continuity of the flow and diminished the amount of water which unimpeded would otherwise have flowed onto plaintiff's land, the court ordered the defendant to restore the flow of water from the spring as it flowed in its natural course without artificial piping or diversion. BURCH V MACKIE (SURFACE RUNOFF).
362 Mich 488, 107 NW 2d 791 (1961).

Descriptors: Surface water, *Alteration of flow, *Michigan, Legislation, Highways, Drainage, Highway effects, *Road construction, *Surface runoff, Drainage water, Surface drainage, Natural flow, Floods, State governments, Administrative agencies, Ditches, Diversion, Judicial decisions.

In the process of a highway improvement the state highway department caused changes in the drainage arrangement previously existing, which resulted in an unreasonable diversion of surface water damaging plaintiff's land. The road construction work also raised the crown of the highway causing a barrier to the natural flow of surface water. The attorney general of the State, appearing on behalf of defendant, filed a motion to dismiss claiming the highway department was engaged in a governmental function and thus immune from suit and liability, and that plaintiffs' proper remedy is afforded by the statutes relating to the establishment of drains by the county drain commissioner. The trial court dismissed the complaint on the basis that the condition complained of by the plaintiffs, may be remedied by proper proceedings under the Frain Code of 1956. The court here affirmed, but there is a separate concurring opinion based on the concept of governmental immunity, and an extensive dissent. (Smith-Fla)
W69-02018

CERNAK V KAY-VEE REALTY (LIABILITY FOR SURFACE DRAINAGE DISCHARGE).
169 N E 2d 879 (Mass 1960).

Descriptors: *Massachusetts, Watercourses, Negligent inundation, Damages, Value, Civil law, Judicial decisions, Outlets, Alteration of flow, *Drainage system, Controlled drainage, Drainage water, Surface runoff, Discharge, *Surface drainage.

Defendant, a land developer, constructed a surface drainage discharge system on its property that collected water from streets in a development project, and channeled it to a discharge pipe. After leaving this discharge pipe, the water passed through a culvert on land owned by a railroad, and then onto plaintiff's land making it very wet and swampy in spots. A landowner is permitted to improve his land by changes of grade, even if the natural course of the surface water is thereby changed, but he will be held liable for damages caused by discharge of water on the land of another by means of an artificial channel, either directly or by seepage. The fact that there was an intervening landowner between the plaintiff's tract and the defendant's tract cannot alter the defendant's responsibility, nor can the fact that other sources may contribute to the flow. (Scott-Fla)

SULLIVAN V BOARD OF COMMISSIONERS OF LORAIN COUNTY (INCREASED SURFACE DRAINAGE FROM UPPER LAND).
172 NE 2d 20 (Ohio Ct App 1960).

Descriptors: Judicial decisions, *Ohio, *Surface runoff, *Ditches, Reasonable use, Rainwater, Sewage effluents, Administrative agencies.

Defendant proposed to enlarge and improve a drainage ditch running from his upper land through plaintiff's lower land, to carry increased surface runoff due to improvement of the upper property and to accomodate sewage effluent from a proposed sewage treatment plant. Plaintiff filed suit to enjoin defendant from undertaking to widen and deepen such ditch. The court held that the ditch was a natural watercourse and if the defendant increased the flow by improving his land, there would be no liability unless he commits unreasonable or negligent acts. One who produces sewage must care for it and not permit it to injure his neighbor. However, since the plant was not yet constructed and placing effluent in the ditch, the court refused to act and said that if future injury did occur, that would be the proper time for judicial intervention. (Williams-Fla)
W69-02021

LOUISVILLE AND NASHVILLE R R V BUS (DRAINAGE OF SURFACE WATER).
336 SW 2d 578-581 (Ct App Ky 1960).

Descriptors: *Kentucky, Judicial decisions, Surface water, Runoff, *Surface runoff, Overland flow, Drainage, *Flood damage.

Appellant railroad company appealed a trial court decision which held it liable for flood damage resulting from drainage of surface water from its higher land onto appellee's lower land. Appellant installed a new drain pipe through railroad fill on the lower side of its property to replace an old damaged culvert. This allowed drainage of surface water from the upper land onto appellee's land. The court held that for appellant to be liable for damage to appellee's land from this flow it had to be shown that appellants had done something to increase the surface water flow, either additional drainage from another watershed or by diverting water from natural drains which otherwise would not have flowed through the pipe onto the low estate. Appellee failed to prove that appellant had done anything to alter the natural surface water drainage. The court reversed. (Sisserson-Fla)

APPLICATION OF HUIE (LIABILITY FOR DIVERSION).
192 NYS 2d 620 (Sup Ct 1959).

Descriptors: Civil law, *New York, *Easements, *Eminent domain, Judicial decisions, Riparian land, *Diversion, Value, Alteration of flow, Riparian rights, Damages, Worth, Property values, Monetary worth, Relocation, Withdrawal municipal water.

In this proceeding by the Board of Water Supply of City of New York, the court held that persons who were nonriparian owners of land but owned easements permitting them and their guests access to the river were not trespassers in the use of river waters, since by implication, easements include the right to use the water. When the City of New York acquired rights to divert a river for the purpose of acquiring an additional water supply, nonriparian property owners having such easements were awarded damages to compensate them for the decrease in value of their lands caused by the diversion. The measure of damages was the difference between the value of their properties immediately prior to and after the diversion of the river. (Scott-Fla)

DUTIES OF CITY ENGINEERS -- POWERS OF POLICE JURIES.

La. RS 1965 33:727 and 1236-1237.

Descriptors: *Louisiana, Civil law, Drainage districts, *Local governments, State governments, Engineering personnel, Drains, Ditches, Canals, Culverts, Streams, Sewers, Water courses (Legal), Dikes, Dams, Levees, Banks, *Navigation, Inland waterways, Transportation, Public health, Seepage, Legislation.

Subject to the supervision and control of the city manager, the city engineer shall manage and have charge of, among other things, the construction, improvement, repair and maintenance of sewers, drains, ditches, culverts, canals, streams, and watercourses. Police juries shall have the power to regulate, among other things, the making and repairing of dikes, dams, and levees; and to regulate the clearing of the banks of rivers and natural drains for the purpose of improving navigation. Police juries may also build dams to prevent the passage or encroachment of salt water into fresh water streams, when such salt water is found to be injurious to property; and may create drainage districts, to control all drainage, drainage ditches, and drainage canals. Police juries may also institute eminent domain proceedings, or purchase or lease lands needed for the construction and improvement of the Inland Water Channel; and may close and dam on its own initiative certain small canals or streams which it finds hazardous or harmful to property or to the public health. (Scott-Fla)

LEVEES AND DRAINAGE IN GENERAL.
La RS 38:111-225 (1965).

Descriptors: *Louisiana, Drainage districts, *Drainage, Local governments, Right-of-way, State governments, Utilities, Construction, Maintenance, *Levees, Overflow, Mississippi River, Bayous, Navigation, Public rights, Eminent domain, Canals, Roads.
Identifiers: Crimes, Criminal offenses.

Any drainage district may contract with the department of public works for drainage and reclamation projects. Local levee authorities shall cooperate with the state and federal governments for construction and maintenance of all levees necessary for protection against overflow of the Mississippi River. The various districts shall control all public drainage channels within the limits of their districts, and for one hundred feet on each side of the channel. When levees cross bayous or sloughs, certain construction methods must be used. Works erected in front of levees shall be destroyed at their owner's expense when they interfere with navigation or the use of the public. Police juries shall have the power to expropriate land or improvements for drainage canals or projects. All levees and parallel or contiguous public roads must be drained. Police juries may also erect back and side levees when needed, as well as temporary levees. Cities and towns have the same general powers as police juries concerning levees. It is a criminal offense to willfully cut or destroy any levee, or to attempt to do so. It is also an offense to ride, drive, or haul upon public levees except where provision is made for same by the levee commissioners; to obstruct drainage by dumping materials into any waters or drains; to drain oil, salt water, or noxious substances into any natural drain or stream; to drain water onto a public road; or to otherwise interfere with or obstruct drainage of any road or channel. (Scott-Fla)

REGULATION OF CANALS.

La RS 1965 45:61-67.

Descriptors: *Louisiana, Hydroelectric project licensing, *Right-of-way, *Canals, Irrigation, Irrigation canals, Navigable waters, Irrigation permits, Public utilities, Hydroelectric power, Hydroelectric plants, Transportation, Transmission lines, Reservoirs, Dikes, Damsites.

Domestic corporations formed for the purpose of constructing and operating canals for irrigation by gravity have the power to obtain rights-of-way by purchase or expropriation, and to use the waters of the state, including navigable streams, for irrigation purposes. Such corporations have the status of public service corporations. Domestic corporations not included above that are organized for the development of hydro-electric power or the transportation of freight or passengers have the power to obtain rights-of-way for these canals and for telephone, telegraph, and hydro-electric lines, as well as lands for reservoirs, damsites, and dikes, by similar methods. Maximum widths for rights-of-way are prescribed. (Scott-Fla)

SAINATO V POTTER (DAMAGES FOR DRAINAGE OF SILT ONTO ADJOINING PROPERTY).
222 Md 263, 159 A 2d 632-636 (Ct App 1960).

Descriptors: *Maryland, *Reasonable use, *Damages, *Deposition (Sediments), Judicial decisions, Water law, Surface waters, Natural flow, Natural flow doctrine, Civil law, Real property, Property values, Depreciation, Obstruction to flow, Surface drainage, Silts, Mudflows, Elevation, Landfills, Grading.
Identifiers: *Remedies, Damages (Legal aspects).

Plaintiffs sued for damages caused by surface water, silt, and debris draining from defendants' property onto plaintiffs' adjoining land. The trial court awarded plaintiffs $1000 damages. Defendants, whose land was higher in elevation, placed fill on their lot and had a bulldozer level it off, thereby pushing the new earth very near the boundary with plaintiffs' land. Mud, silt, and debris were washed by rainfall onto plaintiffs land, killing several trees and destroying plaintiffs' vegetables. When strict application of the civil law rule results in hardship on either the higher or lower landowner, Maryland courts apply the 'reasonableness of use' rule. The appellate court held the plaintiffs were not entitled to recover for the surface water flowing onto their land after the elevation of defendants' property, but they were entitled to recover for defendants' failure to take reasonable precautions to prevent damage from the excess dirt, silt, and debris. After stating the Maryland rule for the measure of damages for injuries to real property, the court upheld the decision holding defendants liable, but reversed and remanded the case for additional testimony on the amount of damages. (Smodish-Fla)

HALL V TOMER (DAMAGES FOR DIVERTING SURFACE WATER).

42 West 41-48 (Pa Com Pl 1959).

Descriptors: Ditches, Drainage, Runoff, Storm runoff, *Surface runoff, Surface drainage, *Natural flow doctrine, *Pennsylvania, Precipitation excess, Pipes, Riddance (Legal aspects), Water law, Damages, Judicial decisions.

Defendants' land lay at a higher elevation than that of plaintiff, and was being developed into a housing division with streets running in the direction of plaintiff's land which diverted water onto plaintiff's land. It was found that plaintiff's land lay in the natural water course for water flowing from defendants' land prior to its development. The owner of

LIBRARY U. OF I. URBANA

upper land has the right to have surface water flowing over his land discharged through a natural water course onto the land of another. Plaintiff requested that defendants install and maintain drainage ditches and pipes over to other drainage facilities at another highway; that defendants remove all debris from plaintiff's land; and that he be awarded $1,860.75 in damages. The court ordered defendants to install drainage facilities sufficient to alleviate the problem caused by defendants' streets diverting surface water, but left it to the defendants to determine how this was to be done. Defendants were not required to remove the debris from plaintiff's land as the precipitation that caused it was extremely heavy resulting in defendants' excavations not being entirely responsible for this mud and silt. This problem of causation also resulted in a damage award of $317.00 instead of that requested by plaintiff. (McDermott-Fla)

WARD V CITY OF GEORGETOWN (LIABILITY FOR FLOODING).
28 111 App 2d 447, 171 N E 2d 653 (1961).

Descriptors: *Illinois, Watercourses, Flooding, *Flood damage, Negligent inundation, Damages, Value, Civil law, Judicial decisions, Dams, Crops, *Eminent domain, Cities.

Action by landowners against city for damage to crops and permanent damage to land caused by flooding which was a result of the city's raising of its dam. The court awarded damages to the landowners, because pursuant to the state constitution, private property should not be damaged for public use without just compensation. The evidence showed that the city's dam was a public use and the damage to the plaintiffs' lands was a direct and immediate result of the construction and subsequent modification of the dam. (Scott-Fla)
W69-02047

WACHSMUTH V STONE'S MARINA, INC. (RIPARIAN RIGHT OF ACCESS).
26 Misc 2d 466, 214 NYS 2d 15-18 (1960).

Descriptors: *New York, Judicial decisions, *Riparian rights, Barriers, *Access routes, Right-of-way, Navigable waters, Boats, Bays.
Identifiers: Limited interference.

Plaintiff sued for a mandatory injunction to require removal of an obstruction, a road crossing, from a waterway. Plaintiff claims that the obstruction, although on defendant's property, deprives plaintiff of his riparian right to gain access to the bay by boat through this waterway. The suit was properly raised under New York statute. The court found that plaintiff rarely used the waterway in question and he had access to the bay from another portion of his land. The construction of the road was not substantial enough to seriously interfere with the use and enjoyment of plaintiff's premises. (Sisserson-Fla)
W69-02049

JOHNSON V WILLIAMS (SURFACE DRAINAGE).

121 S E 2d 223-232 (S C 1961).

Descriptors: *Surface drainage, *Watercourses (Legal), Natural flow, Flooding, Flood damage, Surface runoff, *South Carolina, Repulsion (Legal aspects), Riddance (Legal aspects), Water law, Drainage systems, Water control, *Obstruction to flow, Ditches, Drainage, Pipes.

The respondent and the appellant owned adjoining lands. Water from the lands of respondent and other upper landowners drained across the farm of appellant. The appellant obstructed the flow of this drainage and the respondent brought this action to recover for damages alleged sustained by flooding and for an injunction. The basic issue in the case was whether or not the drainway was a natural watercourse. The respondent contended that it was while the appellant contended that it was not that only surface waters were involved. The obstruction of the flow of surface water is generally not actionable, while the obstruction of the flow of a natural watercourse, if it results in damage to an adjoining landowner, is actionable. This court affirmed stating that there was ample evidence upon which to base the findings of the jury that appellant obstructed a natural watercourse. (Smith-Fla)
W69-02051

EVANS V WHEELER (LIABILITY FOR STREAM RELOCATION).
348 S W 2d 500 (Tenn 1961).

Descriptors: Eminent domain, *Tennessee, Diversion, Alteration of flow, *Relocation, *Damages, Value, Market value, Property values, Worth, Appreciation, Civil law, Judicial decisions, Right-of-way, Land appraisal, Watercourses.

Davidson County diverted a stream and rechanneled it so as to completely remove it from plaintiff's land. Eminent domain proceedings were not instituted because of the County's mistaken belief that the stream was entirely within its right of way. The court said that the measure of damages to which plaintiff is entitled is the decrease in the market value of the riparian land by reason of the diversion of the water. No damages were awarded because by diverting the stream the County had increased, rather than decreased, the value of the plaintiff's land. Prior to the diversion plaintiff's land was subject to periodic flooding, while after the diversion it was suitable for development in the same manner as more valuable adjoining tracts of land. No adjustment was made for appreciation of market value.

FORMAN V FLORIDA LAND HOLDING CORPORATION (ACCRETION - LEGAL ASPECTS).
State of Florida, Tallahassee.

121 So 2d 284-788 (Fla 1960).

Descriptors: *Florida, *Boundaries (Property), Judicial decision, *Riparian rights, *Accretion (Legal aspects), Erosion, Swamps, Coastal marshes, Legislation, Maps, Oceans, Tidal effects, Atlantic Ocean, Shores, Land, Riparian land, Legal aspects.

Appellants contend that Government Lot 2 claimed by the appellees was swamp and overflow land which was acquired by the State of Florida under the Swamp Land Act of 1850, and as such does not support riparian rights as an appurtenance. Therefore, appellants assert that the 1870 west boundary line of New River Sound constituted an established fixed east line of Government Lot 2, and that the owner of this lot enjoyed no riparian rights resulting from any accretion to its eastern boundary. Riparian rights may be appurtenant to swamp and overflow lands conveyed to the state under the Swamp Land Act. In affirming the decision this court found that the evidence sustained the finding that Government lot 1 had submerged as a result of erosion caused by the severity of the elements and that there was no basis for appellants contention that it became an 'immigrant parcel' of land which had migrated intact directly west to a new location on the boundary of Government Lot 2. SEABOARD AIR LINE R CO V COUNTY OF CRISP. (FPC - LICENSING).
280 F 2d 873-878 (5th Cir 1960).

Descriptors: *Georgia, Judicial decisions, Legislation, Federal Power Act, *Hydroelectric project licensing, Hydroelectric plants, Rivers, Navigable rivers, Dams, Administrative agencies, *Water levels, Damages, Impoundments, Local governments, *Embankments, Railroads, Eminent domain, Erosion control.

Crisp County, Georgia was empowered by an amendment to the Georgia Constitution to build a dam across the Flint River and to erect and operate a hydroelectric plant. The river at the site where the dam and generating plant were built was navigable and the county was required to procure a license from the FPC. The building of the dam and the consequent raising of the water level damaged an embankment and trestle of the Seaboard Railroad. The county executed a contract with the railroad in 1939, agreeing to repair the damage done at that time and to protect the embankment in the future. The county repaired the damage in 1939, but refused to repair the current damage. The law in Georgia permits counties to be liable upon their contracts only when the state has authorized the incurring of the liability asserted. This court reversed the decision of the district court for the county on the basis of the broad general power of contract granted in the amendment authorizing the project. (Smith-Fla)

APPLICABILITY OF RULES OF ACCRETION AND RELICTION SO AS TO CONFER UPON OWNER OF ISLAND OR BAR IN NAVIGABLE STREAM TITLE TO ADDITIONS,
C. C. Marvel.
54 ALR 2d 643-655.

Descriptors: *Riparian rights, Riparian land, Judicial decisions, *Accretion (Legal aspects), Islands, Navigable rivers, *Boundaries (Property), *Ownership of beds, Erosion, State governments, Legal aspects, Water law, Mississippi River, Channels, Missouri River, Navigable waters, Legislation.

As a general rule, the owner of an island is entitled to any additions thereto, in the same manner as is the owner of riparian land on the mainland. Both types of owners are equally affected by the existence in a jurisdiction of either of the opposing theories of ownership of the bed of a navigable stream. Under the theory that the state owns the bed, the owner of the island is entitled to all accretions to the island even if the accretions meet other land, or in the absence of a statute to the contrary if the accretions occupy a part of the stream formerly occupied by the land of another which has eroded away. Under the theory that the riparian owner owns to the middle of the stream, the owner of the island is entitled to accretions to the center of the channel between the island and the mainland. LIABILITY, AS REGARDS SURFACE WATERS FOR RAISING SURFACE LEVEL OF LAND,
W. E. Shipley.
12 A L R 2d 1338-1352.

Descriptors: Land development, *Land forming Graded, *Surface drainage, Alteration of flow, Judicial decisions, Surface waters, Diversion, Obstruction to flow, Watercourses (Legal), Water law, *Civil law, Legal aspects, Elevation, Repulsion (Legal aspects), Reasonable use.

One of the ordinary consequences of the filling or grading of land is the diversion of surface water which normally flowed over the land. Because of such diversion, the surface water may flow onto or fail to leave the land of another. The legal problems arising when surface water is diverted by improvements resulting in a general elevation of the surface land are discussed and illustrated by a collection of judicial decisions. Problems created by the blocking of natural or artificial watercourses which drain surface waters are beyond the scope of this annotation. The various jurisdictions are widely divided as to the general rules which govern the rights, duties and liabilities arising from the flow of surface waters. Many jurisdictions have adopted the 'common enemy rule,' others have adopted the

ivil law rule. Both of these rules are discussed at ength including certain modifications such as the easonable user rule. (Smith-Fla)

UBLIC WORKS AUTHORIZATIONS, 1968 IVERS AND HARBORS - FLOOD CONTROL ND MULTIPLE PURPOSE PROJECTS - PART

earings before the Subcommittee on Flood Control - Rivers and Harbors of the Committee on ublic Works, U S Senate 90th Congress, 2nd Session, May 14, 15, 16, 21, 22 and 23, 1968.

escriptors: United States, Legislation, *Indiana, llinois, *Ohio, Flood control, Water supply, iver basins, Reservoir sites, *New York, Channel nprovement, Drainage systems, Dams, Project lanning.
dentifiers: Maintenance costs.

his report to the Subcommittee was on the Vabash River comprehensive study for Indiana, Illinois and Ohio. The main problems indicated were ood control, water quality and supply, and recreation in the Wabash basin. The recommended plan onsists of constructing the Louisville, Helm, Big Valnut and Big Blue Reservoirs, the Downeyville eservoir and the Marion project to meet these ater problems. The report on Port Jefferson Harbor, New York indicated inadequate channel epth. The recommended plan calls for enlarging he channel. The Licking River, Ohio, report indicated a flood problem and a need for water quali control and supply. The recommended plan calls or: (1) Utica dam; and (2) improvement of interir drainage and channel enlargement. This report n Buffalo Harbor, New York, revealed that drift in he waterways is hazardous to small boats, clogs ewers and menaces health. The recommended lan calls for maintenance costs to remove the rift. The report on Cleveland Harbor also reveals rift and the recommended plan calls for mainenance costs for removal. (Childs-Fla)

he Subcommittee considered additional Public Vorks Authorizations. The next reports were on everal Florida projects accompanied by statements from the Florida Board of Conservation. The ade County report indicated an erosion and hurricane problem causing beach loss and tidal flooding. The recommended plan calls for the construction of a protective beach and dune and periodic beach nourishment. The Brevard County report indicated erosion damage threatening upland improvement and reducing beach area. The recommended plan calls for artificial placement of beach fill. The Port Sutton, Tampa Harbor report indicated a navigational problem of insufficient channel depth precluding the use of larger vessels. The recommended plan provides for maintenance of the channel and basin as improved by local interests. The Hillsborough Bay report indicated a hurricane flood problem. The recommended plan calls for an earthfill levee and barrier and construction of a hydraulic model for the study of water utilization and control in the area. The Martin County report showed periodic flooding caused by inadequate drainage and control works. In drought periods irrigation is needed. The recommended plan calls for canals and control structures for gravity drainage. Irrigation features would be deferred. (Childs-Fla)

PUBLIC WORKS AUTHORIZATIONS, 1968 RIVERS AND HARBORS - FLOOD CONTROL AND MULTIPLE PURPOSE PROJECTS - PART 4.

Hearings before the Subcommittee on Flood Control - Rivers and Harbors of the Committee on Public Works, U S Senate 90th Congress, 2nd Session, May 14, 15, 16, 21, 22 and 23, 1968.

Descriptors: *United States, Legislation, *Massachusetts, Channel improvement, *New Hampshire, Flood protection, Water supply, *North Carolina, Water storage, Delaware, Beach erosion, South Carolina, Maryland, Project planning.
Identifiers: Public Works Authorizations, Corps of Engineers Reports.

The subcommittee considered reports by the Corps of Engineers and heard other testimony on Public Works Authorizations. The report on the Ipswich River, Massachusetts, revealed shoaling at the river mouth hindering recreational boating and commercial fishing. The recommended plan called for a channel, two anchorage areas, and a jetty to prevent entrance shoaling. The report on the Beaver Brook Dam and Reservoir, Keene, New Hampshire revealed a flood problem, a need for water based recreation and water supply. The report on the Cape Fear river basin, North Carolina, revealed flood damage and a need for water storage, water quality control and recreation. The recommended plan calls for a dam and reservoir at the Randleman and Howard Mill sites. The report on the Delaware coast revealed beach erosion. The recommended plan calls for beach widening, bulkhead, stone revetment and sand fence construction. The report on the Cooper River, South Carolina, revealed a navigational problem of serious silting and shoaling. The recommended plan is to redivert the Santee River and construction of a hydroelectric plant. The report on the Six Bridge Project in Maryland indicated a water supply and water quality improvement problem. This plan calls for a concrete gravity-earth structure to create a reservoir. SURFACE WATER IN INDIANA,
Thomas L. Shaffer.
Indiana L J, Vol 39, No 1, pp 69-108, 1963. 40 p, 2 tab, 231 ref.

Descriptors: *Indiana, Hydrologic cycle, *Surface waters, *Riparian rights, Topography, Erosion, Evaporation, Repulsion (Legal aspects), Civil law, Flow, Banks, Floodwater, Watercourses (Legal), Irrigation, Streams, Water pollution, *Judicial decisions, Water law.
Identifiers: Soil composition, Common law.

The hydrologic cycle is discussed, particularly with reference to Indiana. The effect of topography, soil composition, evaporation, and growing season on the cycle is covered. The civil and common law governing surface water is set forth. Indiana seems to follow the common law as to lower owners and a modified common law position as to upper owners. Generally, the surface water problem is one of disposal. The problem of defining surface water is examined and the factors for consideration in Indiana are: time of flow, banks, local name or not, direction, origin, usefulness, and distance. Indiana seems to view flood water as surface water if it leaves its watercourse once and for all. The author discusses at great length the rights and duties of upper and lower owners, which have evolved through Indiana case law. Conserving surface water helps restore ground water supplies, keeps lake levels high and assures reliable flows in streams. Also, erosion and flood damages caused by the surface water are mitigated. The idea that surface water is a nuisance is out of date. Any water in the state which can be made to contribute to public needs should be marshalled for this purpose and property owners who marshall it reasonably should be given judicial protection.

STORM FLOWS FROM COMBINED SEWERAGE SYSTEMS IN THREE AREAS,
A. L. H. Gameson, R. N. Davidson, and J. M. Threlfall.
Instn Publ. Hlth Engrs J, Vol 64, pp 182-208, 1965.

Descriptors: *Storm runoff, *Overflow, Discharge (Water).
Identifiers: *Combined sewers, *Calculations.

Results are given of investigations at Northampton, Brighouse, and Bradford on the frequency and duration of operation of storm-sewage overflows on

LIBRARY U. OF I. URBANA

combined sewerage systems and on the volume of storm sewage discharged, since this knowledge is required when determining the optimal setting for an overflow. From the results, equations have been developed which were found to fit not only the data from these three systems but also those from a partially-separate system at Luton; some examples are given of the use of the equations to determine the setting so that the overflow would operate only on a certain number of occasions per year or that the average yearly discharge should be a certain percentage of the rainfall.

STORM-WATER CONTROL BY SIPHON SPILLWAYS AT EARLSWOOD SEWAGE WORKS, REIGATE,
J. M. Harwood.
J Inst Sew Purif, Pt 2, 1960.

Descriptors: *Siphons, *Spillways, *Storm runoff, *Weirs.

At the Earlswood sewage works of Reigate, Surrey, storm water was formerly separated by means of a normal side weir following the line of the main inlet channel, but this was not satisfactory. It was therefore decided to install a series of siphon spillways. The reasons for this decision are listed, and details of the installation are described.
W69-02095

TESTING AND CALIBRATION OF STORM OVERFLOW CONTROL PIPES,
K. Hutton.
Contract Rec, Vol 70, No 23, p 13, 1959.

Descriptors: *Stilling basins, *Overflow, *Flow control, *Storm runoff, Discharge (Water), Velocity, *Instrumentation.
Identifiers: *Suspended solids.

The stilling pond overflow pipe, which provides the most efficient means for the separation of 6 times the dry weather flow from storm water flows, and for removing suspended solids from storm water, is described, and the one in use at Mixenden is presented diagrammatically. Tests carried out at Halifax on this type of overflow and its calibration are given in detail, and show the variation between discharges allowed for in design and those met with in practice. Equations are derived for the determination of several factors including the hydraulic gradient, velocity head, and friction loss. From the studies so far carried out, it was concluded that the stilling pond is the best type of storm overflow at present in general use.

TESTS ON A MODEL STILLING POND WITH SIPHON OVERFLOW,
P. M. Jarrett, H. F. Griffiths, and E. Markland.
Civ Eng Publ Works Rev, Vol 59, 346, 1964.

Descriptors: *Stilling basins, *Model studies, *Siphons, *Overflow, *Water pollution control, *Storm runoff, Weirs, Instrumentation.
Identifiers: *Suspended solids.

The use of stilling ponds is considered to be the most effective way of reducing pollution from storm-water overflows, since an efficient stilling pond should retain much of the solid matter discharged during the first flush of storm water and subsequently pass it down the sewer as the level falls. The authors have carried out preliminary tests on a model stilling pond equipped with a siphon in place of the usual overflow weir; the results, which are discussed briefly, warrant more detailed investigations, using suspended particles of various sizes over a continuously graded spectrum of specific gravity, to establish optimal proportions for stilling ponds with siphon overflows.
W69-02097

CRITICAL OBSERVATIONS ON THE HYDRAULIC DIMENSIONING OF STATIONARY RAIN OVERFLOWS,
J. Jehne.
Wasserwirtsch-Wassertech, Vol 17, No 4, pp 121-127, April 1968.

Descriptors: *Overflow, *Hydraulics, *Storm runoff, Dilution, Sewage sludge.

After presenting the weak points of the notion 'dilution' in hydraulic measurement of stationary rain overflows, the author recommends the specific content (related to the unit of water amount) of one or more components (specific load) as the criteria for the admissible load of the receiving stream. The developed formulas permit: the calculation of the expected upper limit value of the specific load and the calculation of the overflows; the numerical expression of the conditions in case of more overflows from the same collector; and exact information about the effects of sludge whirl-up in the collector or about the imperfect mixing of the individual incoming and outcoming amounts. The influence on the load can be expressed by the (temporary or continuous) magnitude change in one of the load determining factors.

A CONTRIBUTION TO HYDRAULIC CALCULATIONS ON LATERALLY-BAFFLED STORM-SEWAGE OVERFLOWS,
G. J. Kallwass.
Thesis, Technische Hochschule, Hannover, 1964, 165 pp.

Descriptors: Design, *Hydraulic design, *Overflow, *Storm runoff, Weirs, Discharge (Water).
Identifiers: *Calculations.

In connexion with the design of storm-sewage overflows, pilot-plant experiments were carried out at the Institut fur Hydromechanik, Hannover, to calculate the conditions of flow before and after passage over a weir at varying angles, taking into consideration geometrical characteristics when calculating the discharge after a peak load. The equation used for the calculation is based on those for overflowing weirs.
W69-02099

THROTTLE MEASURING DEVICE OF RAIN-WATER OVERFLOWS,
G. J. Kallwass.
Gas-Wasserfach, Vol 109, No 6, pp 150-155, 1968.

Descriptors: *Storm runoff, *Overflow, Outlets, *Weirs, Flow measurement, *Instrumentation, *Model studies.

Rainwater overflows with high weirs and throttled outlet systems have recently been used to limit the load of receiving streams. The infeed system lying above the weir limits the duration and frequency of the overflow. The efficiency of the throttle line is determined by the diameter, the length, and the slope of the bottom of the line. Because of high costs it is not advisable to undertake any reconstruction of the throttling line or to construct it behind already existing non-throttled rainwater overflows. The same holds true for repairs of errors caused by incorrect calculations. In such cases, use is made of the throttle stop. Located above the canal network outlet, the stop closes the flow in the upper infeed section of the network. A method is described to calculate one-sided rainwater overflows with throttle stops. This method can be applied in almost all cases in which, in the infeed portion, a normal streaming run-off (t sub N > t sub gr) is observed or in which, in the case of a shooting normal run-off (t sub N < t sub gr), a streaming run-off above the weir can be forced (S sub N < sub o). The parameters required for the calculations were obtained on models with circular pipes. However, they can be applied for other cross sections as well, provided the same conditions are observed.
W69-02100

THE STORAGE AND DISCHARGE CAPACITIES OF SEWERAGE AND THE OPERATING FREQUENCY OF STORM OVERFLOWS DUTCH METHOD OF CALCULATION,
A. C. J. Koot.
Symposium on Storm Sewage Overflows, May 1967. Sponsored by the Institution of Civil Engineers.

Descriptors: *Discharge (Water), *Storm runoff, *Overflow, Pumping.
Identifiers: *Capacity, Surface permeability, *Calculations.

This system is based on the principle that a system must be filled before diluted sewage is discharged into the surface water. It assumes that part of the precipitation received in the impervious area: (a) flows into the sewerage system; (b) is discharged or pumped off near the end of the main sewer; and (c) may be discharged into the surface water via storm overflows. Calculations are restricted to those for the static storage capacity. The figure calculated is the capacity of the sewer pipes between the top of the lowest overflow (s) and the highest water level in the sump of the pumping station, or level of discharge. The available discharge capacity is considered, with schematic representations for both flat and sloping areas shown. A scatter diagram of the amount of rain in mm's plotted against the duration of the rain in minutes for 195 showers of more than 7 mm. which fell in DeBilt, Utrecht between 1938 and 1948 is also included. On the basis of the given assumptions, it is possible to determine the approximate number of showers giving rise to overflow of sewage for the 11 year period.
W69-02101

THE DESIGN AND EFFICIENCY OF STORM WATER OVERFLOWS IN COMBINED SEWERAGE SYSTEMS,
H. Lohff.
Gesundheits-Ing, Vol 75, pp 397-9, 1954.

Descriptors: *Overflow, *Storm runoff, *Water pollution, Discharge (Water), Design, *Sewage sludge.
Identifiers: *Combined sewers.

The author discusses the problem of pollution of streams by storm water overflows and methods of reducing both the amount of storm water that is discharged and the polluting matter carried. Alterations in the design of the overflow are suggested with special attention to increasing the height of the overflow sill to form a storage chamber where sludge washed from the sewer could collect.
W69-02102

LOSS OF SANITARY SEWAGE THROUGH STORM WATER OVERFLOWS,
J. E. McKee.
Sewage Works J, Vol 20, pp 589-90, 1948.

Descriptors: *Storm runoff, *Overflow, *Rainfall intensity.

Identifiers: *Boston (Mass), *Interceptor sewers, *Combined sewers, Capacity.

Data are given on the rainfall at Boston, Mass.; the effect of rainfall on the flow of intercepting sewers of the combined sewerage system; the proportion of sewage in storm water overflows, and the frequency of overflow. It was found that storm water runoff equal in volume to the dry weather flow of domestic sewage was produced when rainfall was 0.01 in/hr. When twice the average dry weather flow was intercepted about 2.7% of the total amount of domestic sewage overflowed. Overflow occurred about 5-6 times/month in the summer. The effects of increasing the capacity of the interceptors on the amount of sewage in the overflow and on the frequency of overflow is discussed.

RECONSTRUCTION OF OVERFLOWS,
W. H. G. Mercer.
In Symposium on Storm Sewage Overflows, May 4, 1967. Sponsored by the Institution of Civil Engineers.

Descriptors: *Storm runoff, *Overflow, Storms, Design.
Identifiers: *Calculations, *Suspended solids.

The policy adopted by the city of Rochdale to accept all liquid trade wastes made it necessary to recalculate the loads on the entire system. This recalculation led to the decision to reconstruct some of the original storm sewage overflows to accept the additional loads. Since a large number were involved it was decided to reconstruct one overflow on an experimental basis first. Part of the experiment was to determine the conditions when a storm occurred which only just put the overflow into operation. The effect of surcharging the sewer before allowing the overflow to begin was that nearly all floating matter was held back some distance upstream. Matters of public relations undertaken when an overflow in a shopping area was reconstructed are given in detail. Although the work on overflows has formed part of a comprehensive program, the reconstruction of each had its particular problems. Ultimate design was dependent on a number of existing factors, some fixed and some varying with limits. As work progressed, it was observed that: (a) a far greater volume of sewage was being passed to the sewage works; and (b) the discharge of floating matter to the water courses during storms was decreasing.
W69-02106

PRACTICAL DESIGN OF STORM SEWAGE OVERFLOWS,
P. R. Oakley.
In Symposium on Storm Sewage Overflows, May 4, 1967, sponsored by the Institution of Civil Engineers.

Descriptors: *Design, *Overflow, *Storm runoff, Hydraulics, Stilling basins, Equipment, *Weirs.
Identifiers: *Suspended solids.

The extent that the ideals of theory can be realized in the practical design of storm sewage overflows is discussed with special emphasis on efficiency and reliability. Two tests of efficiency for storm water overflows are: (a) hydraulic performance, and (b) separation of suspended solids. Hydraulic efficiency implies that overflow does not commence prematurely and that the base flow does not vary with the rate of overflow. The two possible approaches to efficiency in separation of solids are to use physical methods of restraint or to rely on gravity separation. The relative merits of screening, stilling ponds or vortex action in separation are discussed. Reliability is taken to include safety and convenience in operation as well as the more direct meaning. The structure should be designed for a life in excess of 30 years. Power driven devices are best avoided unless adequate and regular maintenance is assured. Emergency by-pass arrangements should be made. A design of 1937 is illustrated and discussed as well as a high weir type overflow. More opportunity is afforded in designing large overflows on new sections of sewer; one such design is shown. No overflow should be located on sewers less than 18 in. dia. or of maximum flow less than 6 cusecs. For small overflows the storage type are suitable; with larger flows only limited storage is likely to be practicable.

SECONDARY MOTIONS APPLIED TO STORM SEWAGE OVERFLOWS,
T. M. Prus-Chacinski, and J. W. Wielogorski.
In Symposium on Storm Sewage Overflows, May 4, 1967. Sponsored by the Institution of Civil Engineers.

Descriptors: *Storm runoff, *Overflow, *Design, *Model studies.
Identifiers: *Calculations, *Suspended solids.

A model was used to study the possibility of using the helical flow in short bends as a basis for the design of storm sewage overflows. For a short bend a convenient measure of the intensity of the helix is the angle between the circumferential direction and the direction of flow very near to the bed of the channel. Several expressions were developed to predict the value of this angle. There is evidence that in a bend longer than 0=90 the intensity of the helix decreases, and that eventually at 0=180 the direction of water near the bed reverses toward the outer wall. If a relatively short bend is followed by a second of opposite direction, the helix generated in the former suppresses development of the helix in the latter. However, an S channel may be more convenient to use and was therefore investigated. The symmetrical S shape of the channel was chosen so that a number of possible configurations of the relative positions of slots and overflows could be investigated by reversing the channel. Figures are included to show the bed load distribution both with slots closed and opened; the relationship between suspended load and flow through the slot; and the relationship between bed angle in the first bend and Reynolds' number in a semicircular channel. It is concluded that the results of the investigation may be used to design an effective and cheap storm sewage overflow.

ON MEASUREMENTS OF STORM-SEWAGE OVERFLOWS - A GRAPHICAL METHOD,
L. Schmitz.
Gesundheits-Ing, Vol 85, p 363, 1964.

Descriptors: *Storm runoff, *Overflow, *Flow measurement.
Identifiers: *Calculations, Bernoulli's theorem.

Owing to the inaccuracy and difficulty of existing methods of calculations for storm-sewage overflows, a graphical method has been developed, based on Bernoulli's equation. By this method not only can liquid flow through non-uniform pipes measured, but with the application of Bernoulli's theoreum the difference in pressure between the top and bottom ends of the pipe and/or the required section of such vertical tapered pipe can be calculated. Values for the pressure drop, throat diameter and throat length for a minimum pipe-fall of 0.5 per cent and for the friction coefficient of 0.15 and 0.30 in relation to the volume of flow and the head of water are given. Diagrams and tables together with a worked example support the author's method.
W69-02111

MEASUREMENT OF STORM WATER OUTLETS IN COMBINED SEWERS BY THE THROTTLE-PIPE PROCESS,
L. Schmitz.
Gesundheitsing, Vol 79, p 323, 1958.

Descriptors: *Storm runoff, *Outlets, *Overflow, Weirs, Instrumentation.
Identifiers: *Combined sewers, *Calculations.

After discussing the differences between storm-water overflows in combined sewers and straight vertical-flow weirs, the author gives diagrams for the calculation of storm-water overflows when the following pipe is designed as a throttle pipe.
W69-02112

STORM-WATER OVERFLOWS: THE OPERATION AND DESIGN OF A STILLING POND,
D. E. Sharpe, and T. W. Kirkbride.
Proc Instn Civ Engrs, Vol 13, p 445, 1959.

Descriptors: *Storm runoff, *Overflow, *Design, *Stilling basins, *Flow control, Water pollution, *Model studies.

In designing storm-water overflows, the use of stilling ponds has many advantages as it not only permits comparatively accurate regulation of the flow but also results in less polluting matter being discharged. Model experiments were carried out on the operation of stilling-pond overflows with a view to determining the conditions limiting chamber design and to deriving suitable design standards. The flow patterns within a stilling pond were first investigated and the limiting conditions deduced therefrom are presented in a simple form for design application. The applicability of the results to the performance of full-scale overflows is being studied.

DESIGN, CONSTRUCTION AND PERFORMANCE OF VORTEX OVERFLOWS,
B. Smisson.
Symposium on Storm Sewage Overflows, May 4, 1967. Sponsored by the Institution of Civil Engineers.

Descriptors: *Design, *Construction, *Overflow, *Model studies, Outlets, Storm runoff, Rainfall intensity.
Identifiers: *Suspended solids, Calculations.

Using hydraulic models, research was carried out on comparatively small tanks using rotary motion induced by the kinetic energy of the sewage. A considerable increase in the amount of solids concentrated in the foul-water outlet over that due only to gravity was found. The program covered devices with prototype retention times from 20 secs. to 20 min. with energy levels at inlet from 0.05 to 20 ft. lbs./lb. Two full-sized overflow chambers have

LIBRARY U. OF I. URBANA

been built and observed in operation for several years. The model separators tested were of three types. The largest separator is illustrated and described. The results obtained at a 5 min. retention time, with crude macerated sewage having a mean strength of 230 p.p.m. suspended solids, are shown. It was found that a very significant degree of separation took place. To achieve satisfactory conditions of flow many alterations in shape had to be made, in particular a deflecting wall alongside the in-coming sewer. Floating solids were easy to retain by dip-plate. The number of occasions on which the overflow operates per year and the duration of such occasions would give a better criterion for design than any estimate of what should be left in the sewer. A method of design based on statistical analysis of rainfall is given, which enables the designer to choose the size of overflow best suited for any particular site.

HYDRAULIC ASSUMPTIONS IN CALCULATING STORM-WATER OVERFLOWS,
H. Wagner, and G. J. Kallwass.
Gas Wasserfach, Vol 101, p 660, 1960.

Descriptors: *Storm runoff, *Overflow, *Design, Hydraulics.
Identifiers: *Calculations.

The commonly used methods of calculation for storm-water overflows are not suitable for modern designs. The authors discuss conditions of flow, run-off curves, and the friction coefficient and give a diagram for calculation of flow conditions in different shapes of sewer. Sources of error are considered.
W69-02119

THE EFFECT OF DELAYED DISCHARGE ON THE CALCULATION OF STORM-SEWAGE OVERFLOWS,
G. Warg.
Gas Wasserfach, Vol 107, pp 85-89, 1966.

Descriptors: *Overflow, *Storm runoff, Discharge (Water), Design, *Hydrographs.
Identifiers: *Calculations, Munich (Germany), Capacity, Surface permeability, *Urban hydrology, Storage tanks.

The author discusses theoretically the effect of delayed discharge of rain water on the design calculations and measurements of storm-sewage overflows and gives a detailed account of the measurements which were carried out in the sewerage system at Munich to evaluate the effects on discharge capacity, intensity and duration of discharge, load on the receiving water, and dimensions of the sewerage system. He suggests the use of a specially-developed hydrograph system to calculate and allow for changes in permeability at peak flows and to assess the maximal area likely to be covered during rain storms. Tables and nomographs which are included can also be used to calculate the effects of delay on design calculations for storm-sewage plants and flood retention basins.
W69-02120

THE PROBLEM OF SEPARATION IN PLANNING SEWER SYSTEMS,
T. R. Camp.
J Water Poll Control Fed, Vol 38, No 12, pp 1959-1962, Dec 1966.

Descriptors: *Overflow, *Sewers, *Water pollution, Construction costs.
Identifiers: *Sewer separation, *Combined sewers, *Storm sewers, Suspended solids.

Sewers originally were constructed to drain cellars and land, and later were permitted to carry sanitary wastes. Many older cities in the United States have the combined type of sewer system and now face the need for separate systems for sanitary wastewater and stormwater. The costs are estimated to be $10,000-$20,000/acre ($25,000-$50,000/ha), not including the cost of possible repairs to storm sewers. Although only three percent of the annual wastewater production is discharged by combined sewer overflows, greater amounts of bacteria and suspended solids are dislodged by high flows after storms. Other methods proposed to alleviate overflow effects are not so effective as separation.
W69-02121

OVERFLOWS OF SANITARY SEWAGE FROM COMBINED SEWERAGE SYSTEMS,
Thomas R. Camp.
Sewage and Ind Wastes, Vol 31, No 4, April 1959.

Descriptors: *Overflow, *Storm runoff, Rainfall intensity.
Identifiers: *Capacity, *Interceptor sewers, *Combined sewers.

The author notes that it has been shown that the average dry weather flow of sanitary sewage is approximately equal to the runoff from a rainstorm having an intensity of about 0.01 in/hr. For interceptors having a capacity of 2 x dry weather flow, more than 90 per cent of sanitary sewage is discharged in the overflows with a rainfall intensity of 0.2 in/hr or more. With interceptors having capacity of 5 x dry weather flow, about 76 per cent of sanitary sewage is lost during rainstorms having an intensity of 0.2 in/hr and about 90 percent is lost during rainstorms having an intensity of 0.5 in/hr. Frequency of overflows indicate that one may occur every 5 to 6 days during summer with interceptors designed for 1.5 to 3 x average dry weather flow. Chart of frequency of overflows in days/mo vs. capacity of interceptors in terms of average dry weather flow and variable time of concentration.

IMPROVEMENTS IN SYSTEMS OF 'COMBINED' SEWERAGE,
R. C. Carter.
J Instn Sanit Engrs, Vol 49, pp 105-27, 1950.

Descriptors: Water pollution control, *Storm runoff, *Overflow, *Sedimentation, Sewage effluent, Sewage sludge.
Identifiers: *Combined sewers, *Storage tanks, Interceptor sewers, *Capacity.

The author discusses the possibility of reducing pollution caused by discharge of storm water from combined sewers. It would not be economical to build sewers large enough to carry the max. flow to be expected, for example once each year, but storm overflows which discharge to a stream when the flow exceeds 6 x dry-weather flow cause considerable pollution. Storm tanks are a more satisfactory method of dealing with storm water, as sedimentation can take place and the effluent when the tank overflows is of a less polluting nature. It is suggested that an existing combined sewerage system could be expanded by constructing large storm water balancing tanks at various points on the main intercepting sewer. Storm water could be stored in these tanks and discharged to the sewers as capacity is available. A method for calculating the required capacity of the storm water balancing tanks is shown in a table. In discussion, Bevan, E V., Ackers, G. L., and Towsend, G. B., all stated that the chief difficulty with the system proposed would be the removal of the sludge which would accumulate in the balancing tanks and might give rise to septic conditions.
W69-02123

IMPROVEMENTS IN SYSTEMS OF COMBINED SEWERAGE,
R. C. Carter.
Survr, Vol 108, No 3019, p 743, Dec 16, 1949.

Descriptors: *Storm runoff, *Overflow, *Weirs, Design, Pumping, Treatment.
Identifiers: *Storage tanks, Suspended solids.

The author states that storm overflow weirs are a illogical weakness in design and should be eliminated wherever possible. Overflow from storm tanks is much to be preferred to storm sewer overflows as the overflow from the tanks has been rid of virtually all settleable suspended matter. Author derives a procedure utilizing storm balancing tanks which take excess storm water from upper laterals and later return the flow by pumping. Thus the peaks are removed and all storm water ultimately gets treatment, either total or at least storm tank.
W69-02124

ESTIMATION OF THE FLOOD FLOW AND DISCHARGE COEFFICIENT IN SEWERAGE SYSTEMS,
T. Dimchev.
Trud Nauchnoizsled Inst Vodosnab Kanaliz San Tekh, Sofia, Vol 1, pp 53-78, 1964.

Descriptors: *Sewage treatment, *Discharge (Water), Rainfall intensity.
Identifiers: *Calculations, *Urban drainage.

Hydrological observations made in 1958-61 in a area drained by part of the Sofia sewerage syste

are reported and analyzed mathematically with reference to the dry-weather flow and to peak discharges and discharge coefficients in the main sewer, including the effects of surface detention of rain water (which varies with the intensity of rainfall), duration of rainfall (which is inversely related to the peak flow), and the free volume in the sewer.
W69-02125

POLLUTION CONTROL FOR STORM WATERS AND COMBINED SEWER OVERFLOWS,
D. D. Dunbar, and J. G. F. Henry.
Water and Pollution Control, Vol 105, No 11, p 41, 45, 47, 52-3, Nov 1967.

Descriptors: *Water pollution control, *Storm runoff, *Overflow, Design.
Identifiers: *Combined sewers, Capacity, *Intercepting sewers, *Storage tanks, Canada, United States.

Methods and practices in United States and Canada to improve combined sewer efficiency are discussed; problem of how large intercepting sewer capacities should be in relation to average dry weather flow in combined sewer system is dealt with; design of storm holding tanks.

COMBINED SYSTEM OF SEWERAGE WITH LIMITED RAW WATER INLET,
Walo Von Greyerz.
Trans of Int Conf on Sanit Eng, London, pp 170-80, 1924.

Descriptors: Pipes, Sewers, *Storm runoff, *Rainfall intensity, *Runoff forecasting, Drainage systems, *Intakes, Construction costs.
Identifiers: *Combined sewers, Capacity, *Cellar flooding.

The combined system of sewerage while having many advantages is at times criticized because of excessive cost on account of the large pipe sizes required to accomodate the maximum run-off from severe storms which are of short duration. Lack of attention to this condition results in flooded cellars. These objections may be overcome to a large extent by designing the inlets for a limited capacity which the sewer can accomodate and utilizing the storage capacity of the streets to hold the surplus runoff. The streets are thus temporarily flooded to a depth of an inch or two. When the rate of precipitation slackens the stored water quickly drains off through the inlets. This limitation of rain water inlets unites both the simplicity and efficiency of the combined system and two of the advantages of the separate system, namely freedom from risk of cellar flooding and reduced construction cost. Data are presented for the town of Falkenburg for which such a system was designed, taking into account the various street grades and resultant gutter capacities. The methods of computing rates of run-off, inlet sizes, etc. are given in some detail. The discussion disclosed that this method was also in use in India and Panama.

FEASIBILITY OF COMBINED SEWER SYSTEMS,
C. L. Palmer.
J Water Poll Control Fed, Vol 35, 162, Feb 1963.

Descriptors: *Design, Storm runoff, Rainfall intensity, Water quality, Discharge (Water).
Identifiers: *Combined sewers, *Storage tanks, *Capacity.

Any properly designed and constructed combined sewer, without making use of the storm water storage, will produce results in the range of 98 per cent efficiency and any expenditure of public funds to improve its operation should not be made until necessity can be clearly shown. The adoption of the plan of designing storm water storage into combined systems to the extent possible or desirable, will increase the efficiency of any combined system correspondingly. Generally speaking, the designing of storm water storage into a combined system increases the cost very little. Adding this feature to an existing system would cost more but would still not be a major expenditure. Separate systems will discharge to the receiving waters with every storm exceeding 0.03 in/hr or about 89 times each year for the area studied, and the quality of the storm-water discharge will be objectionable and closely comparable to that from a combined system. Combined systems, designed to make use of 'volumetric

LIBRARY U. OF I. URBANA-CHAMPAIGN

storage' for the containment of storm water, and based on the volume of a 1-year storm, would discharge to the receiving water only from 3 to 5 times each year, with a duration of about 0.4 per cent of total time, which corresponds to an efficiency of about 99.6 per cent.

NEW PROCESS FOR SIMPLE CALCULATION OF DILUTION VALUES FOR STORM WATER OVERFLOWS IN COMBINED SEWERAGE SYSTEMS,
S. Pfeiff.
Gesundheits-Ing, Vol 77, pp 74-7, 1956.

Descriptors: *Storm runoff, *Overflow.
Identifiers: *Calculations, *Dilution, *Combined sewers.

The author discusses the uncertainties involved in the usual processes for the calculation of storm water overflows with the help of fixed dilution figures. He recommends the use of local frequency curves based on rainfall statistics, from which in each case a value can be determined for the rainfall limit at which the overflow comes into action. He shows how the overflow and the dilution can be reliably calculated from this limiting figure.

UNDERFLOW SEWERS FOR CHICAGO,
Milton Pikarsky, and C. J. Keifer.
Civ Eng, Vol 37, No 5, pp 62-65, May 1967.

Descriptors: *Tunnels, *Tunnel construction, *Discharge (Water), *Construction costs, *Computer programs, *Overflow, Water pollution.
Identifiers: *Combined sewers, *Chicago (Ill), *Storage tanks, 'Mole' tunneling.

Chicago plans to use a tunneling mole to construct a large tunnel under the rivers and canals into which all of its combined sewers would discharge. The cost of building the tunnel, referred to as the 'underflow mainstream', using this method is $2 million less than that for the conventional open-cut method of construction. The underflow system was simulated by a computer study, the results of which are tabulated. It is felt that the underflow sewer will demonstrate the feasibility of constructing economically a detention resevoir to greatly reduce the river pollution cuased by overflows from combined sewers, far below the surface in public right of way, while providing the conveyance capacity to reduce basement and underpass flooding. It should also demonstrate the practicability of constructing an enlarged underflow mainstream system to serve the entire City of Chicago and the surrounding metropolitan area.

EFFECT OF STORM WATER ON THE SEWERAGE SYSTEM AND THE RECEIVING STREAMS,
F. Popel.
Kommunalwirtschaft, Vol 9, p 340, 1957.

Descriptors: *Storm runoff, *Planning, *Overflow, *Water pollution.
Identifiers: Urban drainage, *Combined sewers.

The author discusses, with special reference to planning of new towns, the effect on streams of storm water overflows in combined sewerage systems. Calculation of the permissible amount must be based on the annual amount of discharge and of polluting matter in it, the self-purifying capacity of the stream, and the use made of the stream water. Investigations are required into the condition of the storm water in modern conditions of traffic and efforts should be made to develop a reliable method of assessing the self-purifying power of a stream receiving sudden discharges of polluting matter.
W69-02153

EXTENSIVE SEWERAGE WILL CURB POLLUTION OF A BAY,
Frederick E. Potter.
Pub Works, Vol 95, pp 104-05, Oct 1946.

Descriptors: *Water pollution control, *Sewage treatment, Outlets, Estuaries, Construction costs.
Identifiers: *Combined sewers, *Interceptor sewers.

Article discusses the pollution problems encountered by the City of Portland, Maine. The municipality is subdivided into nine watersheds, all of which drain to tidal water outlets. The effect of tides plus combined sewerage discharge from the heavily populated areas around 'Back Cove' has created an undesirable situation. Initially, a master plan was developed in 1943 to eliminate pollution within this area by construction of interceptor sewers, pumping stations, treatment plant, and outfall sewer. Recently, construction was completed on the south shore of 'Back Cove' at an expenditure of approximately $1 1/2 million. Construction is expected to begin shortly on the remaining portions of the sewage treatment facilities around Back Cove Bay.

Descriptors: *Storm runoff, *Water pollution control, *Overflow, *Design, Sewage sludge, Pumping.
Identifiers: *Combined sewers, *Dilution, *Calculations, Capacity, *Netherlands.

On the basis of experience in the Netherlands the authors discuss the design of combined sewerage systems and suitable compromises between the requirements of sewage purification and prevention of pollution of streams, with special reference to the calculation of dilution and the design of storm overflows. To avoid the risk of pollution by stirred-up sludge at storm overflows, methods are developed for calculating the frequency of overflow and the relation of storage to discharge capacity with reference to the installation of rain-water pumps. Graphs for the calculations required for the application of these principles are given and their application to projects for combined sewerage systems is discussed.

IMPROVING THE EFFICIENCY OF EXISTING INTERCEPTORS,
Erik Riis-Carstensen.
Sewage and Industrial Wastes, Oct 1955.

Descriptors: *Storm runoff, Rainfall intensity, *Biochemical oxygen demand.
Identifiers: *Interceptor sewers, *Buffalo (N. Y.), *Suspended solids, *Storage tanks.

For the Buffalo New York area, author has derived a characteristic factor for a district 'Ch' which is a ratio of average dry weather flow (gpd) to the runoff (cfs) during a uniform rainfall of 1 inch/hr (Ch = d over c). Study of sewage quality or strength during a 0.55 inch/rain indicates flow doubled, suspended solids 4-5 times, BOD in ppm decreased about 1/3, but total load was higher. During the rain the flow was 5 times and the suspended solids rose to 1220 ppm over an average dry weather concentration of 186 ppm. Author stresses point that the biggest contributor to the suspended solids is the material deposited in the sewers themselves during dwf. Recommends that sewers be constructed to be self-cleansing and also favors small storm water tanks be located on laterals and branches, storm water collected would augment dwf and help keep sewers clean.

A FLOODED-TUNNEL INTERCEPTOR SYSTEM FOR THE METROPOLITAN ST LOUIS SEWER DISTRICT,
W. G. Shifrin, G. K. Hasegawa, and V. C. Lischer.

J Water Poll Control Fed, Vol 39, pp 313-333 1967.

Descriptors: *Drainage systems, *Storm runoff, Discharge (Water), Pumping, *Tunnels, Design, Construction.
Identifiers: *Interceptor sewers, *Combined sewers, *Urban drainage, St. Louis (Mo).

St. Louis, Mo., is divided into three main drainage areas, draining respectively to the Mississippi River, Coldwater Creek, and Sugar Creek. A new sewage works is to be constructed at Bissell Point to serve the northern part of the Mississippi River drainage area, where at present there is a combined sewerage system discharging untreated sewage and storm run-off direct to the river. The advantages and disadvantages of different types of interceptor sewer to carry the sewage to the treatment plant were studied, and it was decided to install the flooded-tunnel type, in which the sewage is allowed to rise in the wet well of the pumping station at the treatment plant to such a level that the upstream hydraulic gradient allows all diversion structures to operate with a free fall as in a gravity system. The design and construction of the interceptor system are outlined and the proposed method of operation, which will depend on river stage and weather conditions, is described in detail.
W69-02158

DIVERSION FACTORS FOR COMBINED SEWERS BASED ON SEWAGE AND STREAM ANALYSES,
R. J. Theroux, and R. L. Meek.
Eng News Rec, Vol 139, p 734, 1947.

Descriptors: *Storm runoff, *Overflow, Biochemical oxygen demand, Dissolved oxygen.
Identifiers: *Combined sewers, *Interceptor sewers, *Capacity.

A rational method of determining the diversion factor for storm overflow is described in which the organic load of the sewage, in terms of BOD, is balanced against the purifying power of the stream as indicated by the flow, deoxygenation, and reaeration consts., BOD, and dissolved oxygen content of the water above the point of diversion. The method enables the maintenance of safe dissolved oxygen contents in the receiving stream without providing unneeded interceptor capacity. The diversion factor should not be less than 1.5.

ONE CITY'S APPROACH TO THE PROBLEM OF COMBINED SEWAGE OVERFLOWS,
D. H. Waller.
Water Sewage Works, Vol 114, pp 113-117, 1967.

Descriptors: *Overflow, *Sewage treatment, *Chlorination, Discharge (Water).
Identifiers: *Interceptor sewers, *Storage tanks, Urban drainage, *Combined sewers.

A description is given of the design and operation of one of two retention tanks constructed to prevent overflows into Halifax Harbour from the 'Arm sewer', an interceptor sewer which drains the west and north-west sections of Halifax, Novia Scotia, which are served almost entirely by combined sewers. The tank, which has a capacity of 1 mil. gal, is provided with an aerated detritus tank through which dry-weather flow passes direct to the interceptor sewer after screening; but when flow in the sewer reaches a maximal level, passage through the detritus tanks is stopped, and the retention tank fills, providing 15-min detention at a design peak flow of 150 ft (3) per sec before overflowing to the Arm sewer. Arrangements are made for chlorination to continue as long as the rate of inflow exceeds the rate of outflow to the interceptor. If the intensity and duration of the storm are sufficient to fill the tank, the chlorinated sewage is discharged to the harbour.

REDUCTION OF HYDRAULIC SEWER LOADING BY DOWNSPOUT REMOVAL,
Gerald L. Peters, and A. Paul Troemper.
No further identification available.

Descriptors: *Sewers, *Overflow, Storm runoff.
Identifiers: *Downspouts.

Methods used and results obtained to correct overloading of sewers by disconnecting roof downspouts from sewer systems in Springfield, Illinois are described. A description of the system existing before the program was initiated is given; data from engineering studies is presented. After the downspout removal program was decided on for suburban Springfield, inspections were made and voluntary compliance by property owners reduced the problem. Administrative and technical problems of the program for the city of Springfield are described. Results of the program are given in tables and copies of letters used are included. Costs, complaints and reduction of the overflow problem due to the program are discussed.

A STUDY OF STORMWATER INFILTRATION INTO SANITARY SEWERS,
Lloyd W. Weller, and Myron K. Nelson.
J Water Poll Control Fed, Vol 35, p 762, June 1963.

Descriptors: *Storm runoff, Surface drainage.
Identifiers: *Sewer infiltration, *Urban drainage, Kansas City (Mo).

This is a discussion of the conduct and findings of a study of a sewer district with a present population of 50,000 (70,000 ultimate) located in the metropolitan area of Kansas City, Missouri. The scope and objectives of this study as regards stormwater infiltration were: ' (1) to make a surface drainage survey of selected areas and a surface inspection of the main sewers to find if any conditions promote the entry of surface water into sanitary sewers, and (2) to collect and evaluate data on sewer use and sewage flows.' A total sewer flow of 104.33 mgd (0.0215 cfs/acre) is developed during large rain storms and it is concluded that 'even during a period of moderate precipitation the major portions of the flow are from sources other than the water-using plumbing fixtures in the residences and public buildings within the district.' During these periods the major source of sewer flow is ground water, presumably from foundations drains used throughout the district. Additional local factors influencing sewer flow are reviewed.
W69-02177

THE DESIGN OF STORM SEWERS,
J. G. Hendrickson, and T. K. Breitfuss.
Pub Works, Vol 87, No 2, pp 91-5, 1956.

Descriptors: Design, *Runoff forecasting, Rainfall intensity, *Storm runoff, Construction, *Intakes, *Outlets, *Manholes.
Identifiers: *Storm sewers, *Capacity.

The calculation of run-off, which is dependent upon intensity, duration, and direction of rainstorms and slope and condition of surface of area to be served, is a very important factor in design of storm sewers. Storm run-off formulae and calculation of run-off are discussed. The authors consider also the design and construction of different types of inlets and outlets for storm sewers, design and location of manholes, and the load-carrying capacity of sewer pipes.

STORM SEWER DESIGN BY THE INLET METHOD,
Albert B. Kaltenbach.
Pub Works, Vol 94, Jan 1963.

Descriptors: *Design, *Intakes, *Storm drains, *Rainfall intensity, Hydrographs, Flow measurement.
Identifiers: *Storm sewers.

The Inlet Method of Design for storm sewers was developed from a continuing research project on storm drains that has been carried on by the Johns Hopkins University for the past 13 years. The article reports this method has shown results closer to and more consistent with actual conditions than any other known design method. The 3 steps involved are (1) determination of peak flows to each inlet based on maximum 5 minute rainfall intensity; (2) attenuating the flow peak from sub-area as it moves down the pipe; and (3) summing each subarea hydrograph to determine the total hydrograph at the design point. A simplified procedure is given for the designs where many inlets are involved.

PROGRESS TO DATE AND CURRENT WORKS AT GLENROTHES NEW TOWN,
G. A. Sutherland.
Instn Municipal Eng, J, Vol 94, pp 325-9, Oct 1967.

Descriptors: *Surface drainage, *Storm drainage, Storms, Flood control, *Design, *Sewers, Runoff, *Discharge (Water), *Hydrograph, *Construction costs, *Rainfall intensity.
Identifiers: *Storm sewers, *Urban drainage.

Glenrothes, the second new town in Scotland, designated under the New Towns Act of 1946, was designated to contain an area of 5,730 acres and a target population of 32,000. Shopping, educational, and housing provisions are briefly discussed. The complete system of foul and surface water catchments is gravity operated and it has not been necessary to resort to either pumping or tunneling to maintain the gravity system. Two catchments, one draining the northern portion of the town (3,550 acres) and one draining the southern portion (2,180 acres) are described. A once in ten-year storm which should produce bank-full conditions and flooding has been provided for by twenty acres of balancing pond capacity based on an average water depth of three ft. This provision is estimated to cost 60,000 pounds. Design considerations are discussed for foulwater sewers and for surface water sewers. Foulwater runoff was based on a future water consumption of 50 gal/head/day. Trunk and development sewers within housing areas were designed for a peak flow of 6 D.W.F. A discharge rate of 7 cumins/acre was calculated for 1/3 of the area; the remaining 2/3 discharging at the rate of 1 cumin/acre. The trunk surface water sewer was designed by the Road Research Laboratory's Unit Hydrograph method for a once per year storm. This method showed an 8% saving in cost over the previously used design method (M.O.H. rainfall intensity curve). Subsidiary sewers were designed using the rational method and Bilham's once per year storm. Continuing rainfall observation is expected to establish a rainfall intensity curve for the area.

EFFECTIVENESS OF THE INTERCEPTION OF SEWAGE--STORM WATER MIXTURES,
Walter G. Shifrin.
U of Missouri Bull, Eng Series Bull No 47, Vol 61, No 8, pp 8-12, Feb 12, 1960.

Descriptors: *Storm runoff, *Overflow, Water pollution control.
Identifiers: *Combined sewers, Calculations, *Interceptor sewers, *Capacity, *St. Louis (Mo.).

Since it is not economically feasible to intercept and treat all of sewage-storm water runoff mixture the study reports on determination of proper interception factor. Average daily sewage flow was converted to an equivalent rainfall of 0.007 in/hr/acre for the area drained by combined sewers. Peak sewage rate was taken as 136% of average or 0.0095 in/hr/acre. Graphs and charts show the author's derivation of number of hours per year sewage would be bypassed. Author's conclusion based on specific case of St. Louis with overflow going to Mississippi River are that selection of interceptor capacities in excess of peak dry weather flow rate will produce an insignificantly small increase in the effectiveness of pollution abatement at a significant increase in the initial cost of the facilities.

STORAGE ROUTING METHODS OF FLOOD ESTIMATION,
E. M. Laurenson.
Instn Engr, Australia-Civ Eng Trans, Vol Ce 7, No 1, pp 39-47, April 1965.

Descriptors: *Flood forecasting, *Model studies, *Rainfall-runoff relationships.

Estimation of floods resulting from rain storms on catchment areas by means of routing rainfall-excess through computational model representing catchment storage is discussed; main methods and concepts necessary to understanding and use of new storage routing technique are reviewed; several concepts are illustrated in example of application.
W69-02243

A CATCHMENT STORAGE MODEL FOR RUN-OFF ROUTING,
E. M. Laurenson.
J Hydrol, Vol 2, pp 141-163, 1964.

Descriptors: *Surface runoff, *Rainfall-runoff relationships, *Model studies, Discharge (Water), *Hydrographs, Storms.

To determine the surface run-off resulting from rainfall-excess a catchment storage model was developed by dividing the area into sections of equal storage delay time. Run-off was routed through the catchment by taking the outflow from a section plus the rainfall-excess as the inflow to the next section. The average delay time was shown to be equal to the lag for a catchment, and an empirical relation was determined between the lag and the mean discharge for a particular flood. The procedure was applied to storm data recorded at the University of New South Wales, South Creek experimental catchment, and the results were compared graphically with actual surface run-off hydrographs. Satisfactory agreement was obtained except in cases where the hydrograph rise was small.

PROGRESS REPORT ON THE STORM DRAINAGE RESEARCH PROJECT, JULY 1ST, 1959 TO JUNE 30TH, 1960,
W. Viessman.
Johns Hopkins Univ, Dept Sanit Eng Water Resour, Baltimore, 1960.

Descriptors: *Storm drainage, *Drainage, *Discharge (Water), *Runoff forecasting, *Rainfall intensity, Weirs, Rain gage, Flow measurement, *Storm runoff, Intakes, *Design.
Identifiers: *Baltimore (Md.), *Urban drainage.

Progress in the storm drainage research project at Baltimore, Md. (see Wat. Pollut. Abstr. 1960, 33, Abstr. No. 2011) is reported, including studies on the effect of slope on the peak discharge from small drainage areas, the effect of antecedent rainfall on the peak rate of run-off, and the relation between the maximum 5-minute rainfall intensity and the duration of the intense part of a storm; the analysis of rainfall and run-off data for the gauged inlet areas; the development of a standard weir for use in hydrological research. It is hoped that the analysis of data from the existing and proposed gauging stations will ultimately permit the development of a satisfactory procedure for predicting flows to storm-water inlets and designing the appropriate drainage system.

PUBLIC WORKS AUTHORIZATIONS, 1968 RIVERS AND HARBORS - FLOOD CONTROL AND MULTIPLE PURPOSE PROJECTS - PART 4.

Hearings before the Subcommittee on Flood Control - Rivers and Harbors of the Committee on Public Works, U S Senate 90th Congress, 2nd Session May 14, 15, 16, 21, 22, and 23, 1968.

Descriptors: Legislation, *Florida, *Water resources, Water conservation, Water distribution, Canals, Levees, *Alabama, Floods, *Kentucky, Ohio River, Reservoir sites, Project planning.
Identifiers: Everglades National Park.

The reports on Florida projects continued. The next report considered water resources for central and southern Florida. The drought of 1961 to 1965 demonstrated the need for improving water conservation for urban and agricultural needs and for preserving the Everglades National Park. The recommended plan calls for modification of the authorized water resources project by (1) raising Lake Okeechobee levees, (2) back pumping excess waters from east coast areas, and (3) improving water distribution by constructing and modifying canals, levees, pumping stations, control structures and related works. The next report on the Alabama-Coosa River Basin revealed that the area was subject to periodic flooding. The recommended plan entails constructing a levee system, pumping plant and drainage structures for Selma and Selmont, Alabama. The report on Southwest

Jefferson County, Kentucky, indicated a flood problem caused by the Ohio River. The recommended plan calls for an earth levee along the Ohio River together with interior drainage facilities. The report on the Licking River Basin, Kentucky, indicated a lack of flood-free land suitable for economic growth. The recommended plan calls for: (1) Royalton Reservoir; (2) two channel improvements; (3) three flood retardation structures; and (4) land treatment measures. (Childs-Fla)

GROUND WATER RECHARGE - CONSERVATION IN NASSAU COUNTY,
W. Fred Welsch.
J Amer Water Works Assn, Vol 52, p 12, 1960.

Descriptors: *Storm runoff, *Groundwater, Outlets, *Drainage, *Stilling basins, Chemical analysis.
Identifiers: *Surface permeability.

Ground water replenishment with storm water serves several purposes: (1) replenish ground water supply, (2) provide drainage outlets without long conduits, and (3) reduce size of conduits for storm water drainage. Recharging done in several ways: (1) for small areas large dia. diffusion pipe installed in caisso. fashion, (2) single basin recharge reservoirs, and (3) two unit basins, first one to act as settling basin and second as seepage or percolation basin. Designed on a 5 in. rainfall in 2 days which has a frequency of about 5 years. Runoff coefficients increasing as area develops and pervious area decreases. Seepage rates for area are approximately 24 gpd/sq ft or 1 mgd/acre. Analyses of storm water basins indicate chlorides of 2.4 ppm, iron 0.1 - 0.8 ppm and D.C. of 132 - 218 ppm. Phenols have been found where runoff is from pavements of bituminous tar material.

PRESUMPTION OF GRANT OF ALL INTEREST.

La. Rev Stat Sec 9:2971 (Supp 1968).

Descriptors: *Louisiana, *Legislation, Contracts, Waterway, Canals, Highways, *Right of way, Railroads, Land tenure, Leases.

Any transfer or other contract affecting land fronting on a waterway, canal, road, or other right of way is conclusively held under this act to include all of the grantor's interest in and under such right of way in the absence of an express provision to the contrary. Where the grantor owns title to the fee of land on both sides of the right of way and grants the land on only one side, it shall be conclusively presumed that all the grantor's interest to the center has been granted in the absence of a contrary provision. No existing valid rights are affected by this act. (Childs-Fla)

EFFECTS ON WINTER STORM RUNOFF ON VEGETATION AND AS A FACTOR IN STREAM POLLUTION,
Richard H. Sullivan.
7th Annual Snow Conf, Milwaukee, Wis, April 12, 1967 6 p.

Descriptors: *Chemical analysis, *Storm runoff, *Highways.

A determination of chloride content of storm water discharge from a section of the Kennedy Expressway in Chicago during the winter of 1966-7 was carried out. Methods and results are given. Salt from snow clearing operations can cause occassional high salt concentrations. Results of tests on storm water from an area in which Cargill's Carguard was used as a corrosion inhibitor are given. Other studies on the effect of chlorides on vegetation are discussed.

EFFECTS OF CONSTRUCTION ON FLUVIAL SEDIMENT, URBAN AND SURBURBAN AREAS OF MARYLAND,
M. G. Wolman, and A. P. Schick.
Water Resour Res, Vol 3, pp 451-464, 1967.

Descriptors: *Water pollution, *Storm runoff, *Sedimentation, Estuaries, *Recreational facilities.
Identifiers: *Urban drainage.

The problem of sediment pollution by run-off from building sites in Maryland is discussed. Sediment yields ranging from 140,000 tons per square mile per year on an open construction site to 1060 tons in an urban area with some development were found. The quantity of sediment from areas under construction is 2-200 times as great as that derived from comparable rural or wooded areas. Details of changes in the stream bed of Oregon Branch caused by sediment from a construction site are given and compared with an unpolluted reach of the stream. Costs arising from sediment pollution of reservoirs, estuaries and channels are discussed and the loss of recreational facilities is mentioned. Measures to control sediment pollution are suggested.

4D. Watershed Protection

COLLECTION AND PAYMENT OF ASSESSMENTS: EXPENDITURE OF PROCEEDS THEREOF AND OTHER DISTRICT FUNDS.

N C Gen Stat Sec 139-27 (1967).

Descriptors: *North Carolina, Legislation, *Administrative agencies, *Taxes, *Assessments, Costs, Government finance, Water resources development, Local governments.

Under Sec 139-27, an assessment against a landowner for a watershed improvement district may be paid in its entirety, upon election, and in the absence of such election, the landowner will be deemed to have elected payment by annual installments. Provisions are made for such annual installments. Receipts and specified collection procedures are required. Receipts are to be sent to the taxpayers. Watershed assessments are to be collected by the county tax collector, and paid over to the watershed improvement district. A limitation period is specified and all proceedings for watershed assessments are to be considered in rem. A form for the assessment receipts is provided. (Williams-Fla)

LIBRARY U. OF I. URBANA

OBSERVATIONS ON DREDGING AND DISSOLVED OXYGEN IN A TIDAL WATERWAY,
Navy Underwater Sound Laboratory, Ocean Sciences Division, New London, Connecticut, and Cornell Univ., Ithaca, New York.
Charles L. Brown, and Robert Clark.
Water Resources Res, Vol 4, No 6, pp 1381-1384, December 1968. 4 p, 2 fig, 4 ref.

Descriptors: *Water pollution sources, *Dredging, *Bottom sediments, *Dissolved oxygen, Suspension, Turbidity.

Study of dissolved oxygen in Arthur Kill and Kill van Kull, Staten Island, New York, during dredging showed that resuspension of oxidizable bottom sediments caused DO reductions of 16-83%. The net seaward movement of water in the streams is very slow. Water remains in the same area about a week and is affected by 2 daily tidal cycles. Wastes are discharged into it at a steady rate; the decrease in DO is caused by resuspension of mud. Dissolved oxygen and secchi disc transparency data are presented in graphs. (Knapp-USGS)

5B. Sources of Pollution

RUTH V AURORA SANITARY DIST (POLLUTION ABATEMENT).
158 N E 2d 601-608 (111 1959).

Descriptors: *Illinois, Judicial decisions, Districts, Municipal wastes, Sanitary engineering, Water pollution, Sources, Disposal, Sewage treatment, *Nuisance (Water law), Sewage effluents, Public health, *Abatement, *Pollution abatement, Water pollution control.

Defendant was discharging untreated or inadequately treated sewage into the river. Plaintiff, a residential subdivision developer was denied permission to connect his subdivision to the sewer system on the ground that it was already operating beyond its capacity, and that increased sewage waste would violate existing rules of public health. Plaintiff sued for abatement of nuisance by establishment of improvements in the collection system and disposal plant. The court held that the abatement of a public nuisance at the suit of an individual to whom the nuisance causes a particular injury was a valid exercise of its jurisdiction, and that the pollution of a river in the above manner is such a nuisance. The selection of the particular method by which this must be done was left to the defendant's discretion. (Scott-Fla)

COMBINED SEWER OVERFLOWS,
Carlysle Pemberton.
Water Resources Engng Conf, ASCE, Milwaukee, Wis, May 13-17, 1963, 20 p, 2 fig, 14 ref.

Descriptors: *Overflow, Flow measurement, *Water pollution, *Biochemical oxygen demand, Storm runoff.
Identifiers: *Combined sewers, *Suspended solids, Chicago (Ill).

A study was made of flow rates and composition of overflows from a large combined sewer serving a residential area of 8.6 square miles with a population of 144,300. Overflows occurred during 1.7 per cent of the time, in a 14-month period when rainfall was about 75 percent of normal. Gross bacterial pollution was discharged during overflows, limiting the use of the receiving waters from a public health standpoint. Suspended solids concentration in the overflow was greater on the average than that of dry weather flow, with considerable variation associated with rainfall intensity and time since the last storm. The 5-day BOD concentration in the overflow averaged about one-half that of dry weather flow, and was found to decrease with time after overflow started. The total BOD load discharged during overflows was 2.5 times the dry weather BOD load for the same number of hours. By extension of the observed data, it is estimated that the BOD load resulting from combined sewer overflows accounts for about 19 per cent of the total BOD load in the canal system serving the Chicago area.

A BRIEF HISTORY OF POLLUTION PROBLEMS AND POLLUTION CONTROL IN THE CITY OF LONDON, ONT,
C. C. Rutherford.
Water Poll Control, Ont, Vol 105, No 5, pp 66-69, 71, 1967.

Descriptors: *Water pollution, *Storm runoff, *Overflow, Water pollution control.
Identifiers: *Combined sewers, Urban drainage.

An historical description is given of pollution problems and control measures in London, Ont., which by the late 1950's was served by 3 overloaded sewage works. Problems included gross pollution of the Thames River by overflows from combined sewers, run-off from septic-tank areas, and flows from industrial sources. Subsequent annexation led to the acquisition of 3 more works; one of the original plants has been closed down and the others have been expanded and modernized. In addition, an industrial waste control programme has been begun, and pollution of the river has been considerably reduced.

POLLUTION OF CITY SURFACE RUN-OFF WATER,
G. G. Schigorin.
Vodosn Sanit Tekh, No 2, pp 19-20, 1956.

Descriptors: *Water pollution, *Storm runoff, *Cities, Rainfall intensity, *Storm drainage.
Identifiers: *Storm sewers, Suspended solids, *Russia, Urban drainage.

To study the polluting effect of run-off from paved areas, samples of storm water collected from the separate storm-water sewers in Vasileostrovsk, U.S.S.R., and of water from street rain receivers after paved streets had been washed with automatic sprinklers, were analysed; the results are tabulated. Marked fluctuations in the concentrations of suspended solids are attributed to the differing degrees of dirtiness of different streets. Heavy rain did not appear to reduce the polluting effect of later run-off, probably because pollution intensities at the points of origin (road sweepings, products of breakdown of pavements, and air-borne contaminants) were relatively constant. Surface run-off from cobbled streets with comparatively light traffic was much less polluting than run-off from asphalt-paved streets with heavy traffic. The need for preliminary treatment of such run-off to reduce pollution of the receiving streams is stressed.

SEASONAL VARIATIONS IN SURVIVAL OF INDICATOR BACTERIA IN SOIL AND THEIR CONTRIBUTION TO STORM-WATER POLLUTION,
Dale J. Van Donsel, Edwin E. Geldreich, and Norman A. Clark.
Appl Microbiol, pp 1362-1370, Nov 1967. 4 fig, 27 ref.

Descriptors: *Bioindicators, *Storm runoff, *Water pollution, *Coliforms.
Identifiers: *Bacteriological sampling.

Survival of a fecal coliform (Escherichia coli) and a fecal streptococcus (Streptococcus faecalis var. liquifaciens) was studied through several years at shaded and exposed outdoor soil plots. Death rates for both organisms were calculated for the different seasons at both sites. The 90% reduction times for the fecal coliform ranged from 3.3 days in summer to 13.4 days in autumn. For the fecal streptococcus, 90% reduction times were from 2.7 days in summer to 20.1 days in winter. During summer, the fecal coliform survived slightly longer than the fecal streptococcus; during autumn, survival was the same; and in spring and winter the fecal streptococcus survived much longer than the fecal coliform. Both organisms were isolated from storm-water runoff collected below a sampling site when counts were sufficiently high in soil. Isolation was more frequent during prolonged rains, lasting up to 10 days, than during short rain storms. There was evidence of aftergrowth of nonfecal coliforms in the soil as a result of temperature and rainfall variations. Such aftergrowth may contribute to variations in bacterial count of storm-water runoff which have no relation to the sanitary history of the drainage area.
W69-02218

A STUDY OF LAKE MICHIGAN: CHEMICAL, BIOLOGICAL, AND PHYSICAL,
J. L. Verber.
Verh Int Verein Theor Angew Limnol, 1965, Vol 16, pp 29-46, 1966.

Descriptors: *Water pollution control, *Overflow, *Storm runoff, Chemical analysis.
Identifiers: Oil pollution, *Lake Michigan.

Comprehensive investigations were made to determine the present water quality in Lake Michigan and make recommendations for its preservation; some of the physico-chemical, bacteriological, and biological results are presented in tables and diagrams and discussed. Sufficient vertical mixing occurs during spring and autumn to distribute the chemical constituents uniformly throughout the water column. It is concluded that the lake is still oligotrophic but precautions must be taken to reduce the build-up of phosphates and nitrates in certain areas where municipal and trade waste waters are discharged, particularly in the southern basin where there appears to be a large semipermanent clockwise gyral which tends to prevent dispersal of nutrients from the basin into the rest of the lake; chemical and biological differences between the northern and southern basins also indicate that horizontal mixing is very slow. The zone of poor-quality water along the coast near waste outfalls varies in width depending on the meteorological conditions. Preliminary action has been taken to reduce pollution, especially that caused by storm-sewage overflows and by oily, phenolic, and other trade waste waters.
W69-02219

STORM SEWAGE OVERFLOWS - A MAJOR POLLUTION SOURCE,
K. H. Walker.
Wastes Eng, Vol 33, No 8, Aug, 1962.

Descriptors: *Storm runoff, *Overflow, *Water pollution.
Identifiers: *Combined sewers, Boston (Mass), New York (NY).

This editorial stresses the need for further study and data to aid in solving the problem of storm sewage overflow. 1946 studies using Boston rainfall records show that sewage systems designed to handle 2 to 3 times average dwf would overflow 5-6 days/mo. The study also showed that with rainfalls of 0.20 inches/hr., nearly 90% of sanitary sewage would be discharged untreated. A New York City study showed that 60 to 80% of the raw sewage flowing through combined systems is discharged into the receiving waters once or twice a week.
W69-02221

URBAN LAND RUN-OFF AS A FACTOR IN STREAM POLLUTION,
S. R. Weibel, R. J. Anderson, and R. L. Woodward.

J Water Poll Control Fed, Vol 36, pp 914-924, 1964.

Descriptors: *Water pollution, *Storm runoff, *Biochemical oxygen demand, *Turbidity, Chemical analysis, *Pathogenic bacteria, *Coliforms.
Identifiers: *Urban drainage, *Suspended solids, Surface permeability.

After reviewing briefly the work of other investigators on the composition and strength of run-off from urban areas, the authors describe a study carried out in part of Cincinnati, where about 37 per cent of the total drainage area is impermeable, the remainder being lawns, parks and gardens. The run-off had an average B.O.D. of 19 mg per litre, a chemical oxygen demand of 99 mg per litre, a suspended-solids content of 210 mg per litre, a turbidity of 170 units and a colour of 81 units. The run-off was also found to contain organic chlorides, which could be derived from pesticides, and large numbers of bacteria, although faecal streptococci exceeded faecal coliform organisms, indicating predominantly non-human pollution. The highest concentrations of all contaminants occurred within the first 15 min of the start of run-off. These results confirm that run-off should be taken into consideration when estimating waste loadings from urban sources, and the authors stress the need for further studies to estimate the strength of run-off under various conditions.
W69-02223

CHARACTERIZATION, TREATMENT AND DISPOSAL OF URBAN STORM WATER,
S. R. Weibel, R. B. Weidner, and A. G. Christianson.
Proc 3rd Int Conf Water Poll Res, Munich, 1966, Vol 1, pp 329-352, 1967.

Descriptors: *Water pollution, *Storm runoff, *Chemical analysis, Rain, *Coliforms, Recreation facilities, *Sewage treatment, Chlorination, *Biochemical oxygen demand, Sedimentation, *Groundwater recharge.
Identifiers: *Urban drainage, *Suspended solids, Long Island (NY).

The authors give further results of studies at Cincinnati, Ohio, on the polluting effect of run-off from urban areas, including investigations of the chemical composition of the rain falling on the study area. The rain water was found to contain, on average, 0.69 mg of inorganic nitrogen and 0.24 mg of hydrolysable phosphate, per litre; these concentrations exceed the threshold values found by other workers for the development of algal blooms. The rain water also contained about 0.28 microgram of organic chlorine compounds per litre; DDT, DDE, and benzene hexachloride were identified. Analyses of the run-off, as reported previously, showed its pollution potential, and the concentrations of coliform organisms exceeded the criterion of 1000 per 100 ml recommended for bathing waters. Preliminary laboratory experiments on treatment of the run-off showed that sedimentation alone was not effective in reducing the BOD and suspended-solids content. Sedimentation for 20 min combined with chlorination at a dose of 4.62 mg of chlorine per litre killed more than 99 per cent of the bacteria; when the supernatant liquor was dechlorinated, however, and kept at room temperature for 24-72 hours, there was aftergrowth of coliform organisms, though not of faecal coliform bacteria or faecal streptococci. This work is still being continued. On Long Island, N. Y., storm run-off is being disposed of successfully by infiltration through the sandy sub-soil to recharge the groundwater resources in the area.

PROTECTIVE MEASURES AND THE TORREY CANYON,
New Mexico Univ.
A. E. Utton.
Boston College Ind and Com L Rev, Vol 9, No 3, pp 613-632, Spring 1968. 20 p, 99 ref.

Descriptors: *Oily water, Oil wastes, Water pollution, Water pollution sources, *International law, *International waters, Water pollution control, Oil, Oil industry, Beaches, Aquatic animals.
Identifiers: Contiguous zones, Territorial waters.

The article examines what actions may be taken by a nation to protect itself from oil pollution damage caused by tanker accidents such as the Torrey Canyon incident of 1967. There is general agreement that a state may take unilateral action within a 'contiguous zone' outside its territorial waters under some circumstances. The 1958 Geneva Convention on the Territorial Sea and the Contiguous Zone fixed the zone at 12 miles and severely limited the situations in which action might be taken. Measures to curb oil pollution in the Torrey Canyon incident were probably properly taken under standards allowing the prevention of infringement of sanitary regulation. It is submitted that the state may exercise whatever control is 'necessary' to precent infringement as long as the control is 'proportioned' to the danger threatened. It is also contended that the realities of the situation limited by concepts of necessity and proportionality should control actions rather than the inflexible 12 mile limit. Allowable action should include before the fact regulation to prevent accidents as well as measures taken afterward. The article concludes that the most desirable approach is to reduce the likelihood of such situations as the Torrey Canyon incident through international agreement on navigational aids, traffic routes, and restoration measures. COAL MINING EFFECT ON BUSSERON CREEK WATERSHED, SULLIVAN COUNTY, INDIANA,
Indiana Univ., Bloomington.
Don M. Corbett, and Allen F. Agnew.
Water Resources Res Center, Rep of Invest No 2, 187 p, July 1968. 23 fig, 1 plate, 37 tab, 8 ref.

Descriptors: *Acid mine water, *Indiana, Water quality, Discharge (Water), Storm runoff, Hydrographs, Dams, Reservoirs, Acidity, Iron, Sulfates.
Identifiers: Busseron Creek, Wabash River, Sullivan County (Indiana).

The chemical quality of water in the Busseron Creek Watershed, tributary to the Wabash River, Indiana, was studied to determine the effects of acid mine drainage on water quality in 26 reservoirs being constructed by USSCS. Sedimentation damage from coal mining is not serious. Streamflow data were collected for 2 years and 450 chemical analyses were made. Adic water is found in Big Branch in which 26% of the drainage area is disturbed by surface mining, Buttermilk Creek, 7% disturbed, and Sulfur Creek, 12% disturbed. The acid is contributed by both surface and underground mining. The other streams in the watershed are relatively unaffected by mining and have good quality water. Flushing of the streambeds during high flow causes temporary high concentrations of mining waste pollutants. Magnitude and frequency of storm runoff affect acid concentrations in the watershed. Present mining operations contribute no acid, which originates in old waste piles and surface mining areas. (Knapp-USGS)

THE VARIATION OF WATER TEMPERATURES DUE TO STEAM ELECTRIC COOLING OPERATIONS,
Vanderbilt Univ., Nashville, Tennessee, and Johns Hopkins Univ., Baltimore, Maryland.
John E. Edinger, Derek K. Brady, and Willard L. Graves.
J Water Pollut Contr Federation, Vol 40, No 9, pp 1632-1639, Sept 1968. 8 p, 4 fig, 3 ref.

Descriptors: *Water temperature, *Heated water, *Thermal powerplants, *Cooling water, Lagoons, Streams.

In a study of temperatures in an artificial lake constructed to cool water discharged from a generating station before returning it to the stream from which it was taken, it was found that water temperatures vary with time due to changing plant loading and meteorological conditions. The time-averaged temperatures as well as the amplitude of the plant temperature variation decrease with distance from the discharge area and approach the water temperatures that would result from meteorological influences alone. As part of a continuing research on condenser water discharge, a study of the combined influence of varying plant loading and meteorological conditions on water temperatures has been made to test various time-varying prediction methods. Derivation of exponential equations used and a sample problem are included. (Knapp-USGS)

DIFFERENCE MODELING OF STREAM POLLUTION,
Oregon State Univ., Corvallis, and New York Univ., New York.
David A. Bella, and William E. Dobbins.
ASCE Proc, J Sanit Eng Div, Vol 94, No SA 5, Pop 6192, pp 995-1016, Oct 1968. 22 p, 11 fig, 4 tab, 4 ref.

Descriptors: *Water quality, *Estuaries, *Mathematical models, *Path of pollutants, Computer models, Digital computers, Tides, Water pollution, Dispersion.
Identifiers: Finite difference methods.

Finite-difference methods are developed for the numerical analysis of BOD and dissolved oxygen profiles confined to cases which may be treated as one-dimensional problems. Temporal and spatial variations of hydraulic parameters and sources and sinks of BOD and dissolved oxygen can be incorporated into the models developed. Results obtained by the methods developed compare favorably to the results of available analytical solutions. For estuaries, the methods are applicable to the analysis of the variations of BOD and dissolved oxygen profiles within a tidal cycle. Significant variations of these profiles from those obtained by the commonly used quasi steady-state approach are demonstrated. The spreading which results from the tidal velocity variation is shown to have a significant effect on the BOD and dissolved oxygen profiles. The methods developed should prove useful in studies of estuaries in which the tidal variations are large and the temporal variations in the strengths of the BOD and dissolved oxygen inputs are great. Descriptors: *Dispersion, *Path of pollutants, *Tracers, *Routing, Digital computers, Computer models, Radioisotopes, Gold radioisotopes, Computer programs.
Identifiers: Longitudinal dispersion, Copper Creek (Va.), Clinch River (Tenn.), Powell River (Tenn.), Coachella Canal (Cal.).

Data from longitudinal dispersion studies by radioactive tracer, conducted by the United States Geological Survey during 1959-1961, are reanalyzed using more recent techniques. Data from 10 tests in 6 streams are examined. Methods available in the literature for calculating dispersion coefficients from tracer data are reviewed, and different methods applied to the same data are found to yield different results. A new method (routing

LIBRARY U. OF I. URBANA

procedure) is proposed, which uses a computer program to determine whether a suggested dispersion coefficient for a given stream predicts downstream tracer passage from upstream data. If the prediction is not adequate, the coefficient is adjusted until the coefficient giving the most accurate prediction is found. The dispersion coefficients obtained by the routing procedure are used to test a theory for predicting dispersion coefficients, proposed by the writer in a separate paper. The predicted and observed coefficients agree within 30% in half of the tests, and in the remainder (including some highly nonuniform streams) within a factor of 4. (Author)

SELECTIVE EROSION OF SOIL FERTILITY CONSTITUENTS,
Wisconsin Univ., Madison, Dept. of Soils.
H. F. Massey, and M. L. Jackson.
Soil Sci Soc Am Proc, Vol 16, pp 353-356, 1952. 4 p, 1 fig, 5 tab.

Descriptors: *Eutrophication, *Nutrients, *Soil erosion, *Leaching, Erosion, Soil properties, Soil chemistry, Fertilizers, Soil groups, Water pollution sources, Regression analysis, Correlation analysis, Estimating equations, Wisconsin, Runoff, Organic matter, Nitrogen compounds, Phosphorus compounds, Potassium compounds, Ammonium compounds.
Identifiers: Fayette silt loam, Almena silt loam, Miami silt loam, Silt loams, Predictive equations, Available phosphates, Exchangeable potassium, Organic nitrogen, Ammonia nitrogen.

Runoff samples from experimental plots at four locations in Wisconsin were analyzed for total soil material, organic and ammonia nitrogen, available phosphorus, and exchangeable potassium. Correlation studies were carried out to relate selectiveness of the erosive process for a given fertility constituent to quantity of eroded soil and concentration of suspended solids in runoff. The relationship was found to be highly significant (probability level, 0.01), with multiple correlation coefficients of 0.63 for available phosphorus, 0.79 for nitrogen and for organic matter, and 0.87 for exchangeable potassium. Selectiveness of the erosive process for the four fertility constituents determined increases in the order: organic matter, organic and ammonia nitrogen, available phosphorus, exchangeable potassium. At average values of erosiveness encountered in this study, the eroded soil material contained 2.1 times as much organic matter, 2.7 times as much nitrogen, 3.4 times as much available phosphorus and 19.3 times as much exchangeable potassium as the soil proper. Analysis of regression equations derived by methods described by author indicate that these four silt loam soils fall in two classes, with Almena, 3% slope, and Miami, 9% slope, exhibiting less selective erosion, and two Fayette soils, 20% and 11% slope, exhibiting more.

5C. Effects of Pollution

LIABILITY FOR INJURY TO PROPERTY OCCASIONED BY OIL, WATER, OR THE LIKE FLOWING FROM WELL,
G. Van Ingen.
19 ALR 2d 1025-1045 (1951).

Descriptors: *Saline water, *Oil wastes, Natural gas, Oil, *Oil wells, Artesian wells, *Remedies, Judicial decisions, Damages, Pollution, Wells, Oily water, Legislation.
Identifiers: Gas wells, Salt wells, Sulfur wells, Injunction, Negligence.

Owners and operators of gas or oil wells are generally liable for injury to another's property caused by oil or water flowing from the wells. Liability of a lessee of oil or gas wells to the owner or lessee of surface lands embraced in the lease is limited to injury to parts of the land not essential to his operations. In addition, owners or operators of gas or oil wells are liable for injury to property caused by stream pollution. Liability is usually based on negligence or nuisance, although in a few cases it is predicated on statute. A few cases have extended liablity to include injunction as well as damages. Where several operators have contributed to the injury they have been held jointly, jointly and severally, or severally liable. Owners of salt or sulfur wells may be enjoined from depositing salt and sulfur into streams so as to pollute them or injure lower property. Owners of water wells have been held liable for allowing flow from the wells to injure lower land; but in cases where the water was allowed to flow into a natural watercourse without negligence or malice, no liability was found, even though a lower owner was injured. (Kahle-Fla)

LIBBRA V MT OLIVE AND STAUNTON COAL CO (LIABILITY FOR FLOODING AND CONTAMINATION).

29 111 App 2d 396, 172 N E 2d 813 (1961).

Descriptors: *Illinois, Watercourses, Damages, Flood damage, Crop production, Agronomy, Civil law, Judicial decisions, Value, Worth, Property values, Monetary worth, *Soil contamination, *Water pollution, Acid streams, Path of pollutants, Water pollution effects.

Plaintiffs sued defendant coal company for damages to their farm and its crops caused by slack, coal dust, and other debris deposited by defendant in a stream which ran through both parties' premises. Due to the occasional overflow of the stream over a period of several years, the debris was deposited in varying amounts at different places on plaintiffs' property. As a result, the land was made too acidic to grow crop; and because it was deposited at irregular intervals, it was difficult to farm portions of the premises where there was no debris. The court awarded damages to the plaintiffs. Damage to the land was assessed at the difference in value before contamination and after contamination. Damage to the growing, unmatured crops was assessed at the value of the crop as it was when destroyed with the right of the owner to mature and harvest it at the proper time. Recovery for damage to crops for three succeeding years was allowed because of the continuing damages caused by subsequent flooding and debris deposits. (Scott-Fla)

SEWAGE DISPOSAL IN THE REGION OF THE LOWER LAKE THUN,
W. Spring.
Gas Wasserfach, Vol 104, pp 1397-1398, 1963.

Descriptors: Pumping, *Storm runoff, *Overflow, *Water pollution.

Attempts to maintain the purity of Lake Thun, Switzerland, have resulted in communal sewage disposal. Owing to the geological position of the lake the sewage flows without pumping to the lower region, where it reaches the pumping station at Durrenast and is then pumped into the treatment plant at Uetendorf, near the Aare. Additional pumping stations are planned for Gwatt, Einigen, Spiez and Faulensee, and special reference is made to the problems of planning sewage works for the future, in which the population index should be considered. The author also discusses the effect of storm-sewage overflows on receiving waters.

Identifiers: Dilution, *Urban drainage, Bacteriolo ical sampling.

Green Lake in Seattle, Wash., was studied to fi the causes underlying its heavy algae blooms a alleged condition of pollution so that its recr tional potential might be realized. Data were c tained on urban runoff, lake shore runoff, subs face inflow, algae populations, waterfowl, compo tion of sediments, effect of wind-induced curre on water quality, and requirements of compet recreational water uses. Water and nutri budgets are presented. Nutrient additions sust heavy algae blooms throughout most of the ye and little can be done to reduce these additio Bacterial contamination is directly related waterfowl populations. Changes in physical a chemical water quality are caused largely by al growth and decay. Recommendations are given the addition of low-nutrient city water for dilut purposes, for dredging, and for shoreline impro ments. It is recommended that increased quanti of storm water not be added.

FFECTS OF SURFACE MINING ON FISH AND ILDLIFE IN APPALACHIA,
ureau of Sport Fisheries and Wildlife.
seph A. Boccardy, and William M. Spaulding, Jr.

ur of Sport Fisheries and Wildlife, Resource ublication 65, 20 p, June 8, 1968. 10 fig, 4 tab, 27 f.

escriptors: *Mine drainage, *Aquatic environent, *Fish, *Wildlife, Fishkill, Fish management, shing, Water quality, Appalachian Mountain Reon.

he effects of strip and surface mining on the fish d wildlife resources in eight Appalachian States ere studied during a tour of mined areas by mems of a team of specialists from six Federal agenes. Surface mining has caused extensive damage fish and wildlife habitats and populations. A total 832,605 acres of land have been disturbed; 81% which are in Ohio, Pennsylvania, and West Virnia. More than 5,000 miles of Appalachian reams and 13,800 acres of impoundments have en seriously contaminated by acid mine water, me of it from surface mining. Additional water s been adversely affected by tremendous quantis of silt and sediment. Reclamation of mined nds is needed. Three of the eight States visited in 65-66 had no laws requiring restoration of stripned lands, and other States needed stronger laws d more enforcement. Virginia and Tennessee ve since passed laws governing strip mining. eclamation as currently practiced in the Aplachian region does not adequately restore ned lands to minimal standards necessary to proct and improve fish and wildlife resources. uthor)

SAMPLE DESIGN FOR INVESTIGATING IE EFFECTS OF STREAM POLLUTION ON ATER BASED RECREATION EXPENDIURES,
nnsylvania State Univ., Institute for Research on nd and Water Resources.
esley H. Long.
ater Resources Bull, Vol 4, No 3, pp 19-26, Sept 68. 8 p, 1 tab, 5 ref, 1 append.

escriptors: *Recreation, *Water pollution, *Cost alysis, *Water sports, Aesthetics, Attitudes, onomic impact, Public health, Safety, Regresn analysis, Sampling.

sample design is presented for selecting streams an investigation of the relation between water pollution and water based recreation expenditures. The design is a proportional sample of clusters of streams stratified in a two-way scheme. The clustering is achieved by sampling 7 1/2 minute topographical maps, and the stratification by using measures connected with water pollution to classify the clusters. The design is based on considerations of economy in data collection and computational efficiency. A distinctive feature of the design is that data collected are to be used in a regression analysis. Thus, the sample size is determined by trying to achieve a given degree of precision for the regression coefficients. (Author)

WATER POLLUTION -- 1968, PART 1.

Hearings - Subcommittee on Air and Water Pollution, Committee on Public Works, U S Senate, 90th Congress, Second Session, pp 1-199, March 27, 1968. 199 p, 4 append.

Descriptors: Legislation, Air pollution, Water pollution, *Water pollution control, Water pollution sources, Water purification, *Sewage treatment, *Water rates, Eutrophication, *Waste water treatment, Waste water (Pollution).
Identifiers: *Federal Water Pollution Control Act.

Hearings of the subcommittee of air and water pollution taken on March 27, 1968 are covered. The matters before the subcommittee were the activities of the Federal Water Pollution Control Administration and water quality standards. The reason for the hearings was pending legislation on air and water pollution being considered by the full committee on Public Works. The hearing record reflects the status of states complying with federal water quality standards. Much of the material found in the record is concerned with municipal sewers and purification plant facilities. The appendix includes a listing of state water quality standards, the status of federal approvals, and a report of activities of the Federal Water Pollution Control Administration through June, 1968. (Crabtree-Fla)

MUNICIPAL SEWER SERVICE CHARGES.

Hearings - Subcommittee on Air and Water Pollution - Committee on Public Works U S Senate - 90th Congress, Second Session, pp 59-174, Mar 27, 1968.

Descriptors: *Cities, *Municipal wastes, *Financing, Municipal water, *Water rates, Water purification, Sewage treatment, Sewerage, United States, Community development, Sewage disposal, Local governments, Utilities, Water treatment, Water works.
Identifiers: *Sewage charges.

This article analyzes the fundamentals that require consideration when a municipality adopts a system of charges for the use of its sewer system and purification-plant facilities. It also presents a series of sewer-service charges in use in selected areas throughout the United States, and gives some indication of the sewerage system that they help finance. Also included is a study that shows how cities can design and operate their sewerage purification plants so as to make them centers of civic interest and places where people like to come and visit. The article was taken from the American City Magazine. (Crabtree-Fla)
W69-02064

MODERN SEWER-SERVICE CHARGES, PART I - WHY CITIES NEED THEM.

Hearings - Subcommittee on Air and Water Pollution - Committee on Public Works U S Senate - 90th Congress, Second Session, pp 67-71, Mar 27, 1968.

Descriptors: *Sewerage, *Financing, Taxes, *Tax rate, Water rates, Costs, Local governments, Cities, Tennessee, Environmental sanitation, Sewage, Sewage treatment, Sewage districts.
Identifiers: *Sewer-service charges, Chattanooga.

The reason for the use of sewer service charges is that they avoid taxes. The principle benefit is that the public does not like taxes but will accept a charge that pays for a service that it comprehends. Shifting the financial burden of sewerage works from ad valorem taxes to sewer-service charges results in a wider array of contributors. Churches, schools, and other governmental units which do not pay property taxes immediately become paying customers. Additionally, the homeowner pays more nearly in proportion to use and commercial users pay likewise rather than being taxed on assessed valuation. The service rates of Chattanooga, Tennessee are presented. (Crabtree-Fla)
W69-02065

MODERN SEWER-SERVICE CHARGES, PART II - SOME TYPICAL RATES.

Hearings - Subcommittee on Air and Water Pollution Committee on Public Works U S Senate - 90th Congress, Second Session, pp 72-77, March 27, 1968.

Descriptors: Iowa, Minnesota, Pennsylvania, Ohio, Florida, Wisconsin, *Sewerage, Financing, *Water rates, *Plastics, Pipes, *Tax rate, Cities, Sewage treatment.
Identifiers: *Sewer-service charges, Ames (Iowa), Anoka (Minnesota), Bethal Park (Pennsylvania), Circleville (Ohio), Hollywood (Florida), Kissimmee (Florida), Lorain (Ohio), Oshkosh (Wisconsin).

This part presents the sewer-service rates of eleven typical municipalities. Several systems of charging are utilized. These are: (1) cubic feet, (2) gallons, (3) facility, (4) fixture, and (5) flat rate. Also included in this part is a short article on how a plastic-pipe is useful in preventing salt-water infiltration. (Crabtree-Fla)
W69-02066

WATER POLLUTION -- 1968 PART I -- (MODERN SEWER-SERVICE CHARGES, PART 3, METERED VS FLAT).

Hearings - Subcommittee on Air and Water Pollution, Committee on Public Works, U S Senate, 90th Congress, Second Session, pp 78-81, March 27, 1968. 4 p, 4 tab, 5 ref.

Descriptors: *Rates, Sewage disposal, *Municipal wastes, Sewage districts.
Identifiers: *Sewage rates.

The merit of metered sewer-service charges as compared to the flat rate charge is discussed. 85% of water distributed today is metered, but only a slight majority of cities using sewer-service charges favor metered charges. Some of the reasons for this are: (1) There is no inexpensive and convenient

LIBRARY U. OF I. URBANA

sewage meter; (2) All of the water which flows through a customer's water meter does not find its way to the sewer; (3) Flat rates usually reduce administration costs; and (4) The difficulty of treating the sewage varies with strength as well as with volume. However, because flat rates are based on fixtures and not usage, metered rates yield revenues more nearly proportional to the volume of sewage. (Crabtree-Fla)
W69-02067

WATER POLLUTION -- 1968, PART 1 -- (MODERN SEWER-SERVICE CHARGES, PART 4, THAT ELUSIVE PERCENTAGE).

Hearings - Subcommittee on Air and Water Pollution, Committee on Public Works, U S Senate, 90th Congress, Second Session, pp 82-86, March 27, 1968. 5 p, 9 tab.

Descriptors: *Rates, *Sewage, Sewers, Sewage districts.
Identifiers: Sewer-service charges.

The practice of establishing sewer-service charges as a particular proportion of the water rate is examined. Generally, sewer-service charges are between 30% and 200% of the water rate. Primary attention is given to comparing various cities as to how their water rates compare with their sewer-service charges. The conclusion is that percentage rates mean little because dollars, not percentages of the water bill, construct and operate plants. (Crabtree-Fla)
W69-02068

WATER POLLUTION -- 1968, PART I -- (MODERN SEWER-SERVICE CHARGES, PART 5, PENALTIES HURT YOUR UTILITIES).

Hearings - Subcommittee on Air and Water Pollution, Committee on Public Works, U S Senate, 90th Congress, Second Session, pp 87-92, March 27, 1968. 6 p, 9 tab, 4 ref.

Descriptors: *Rates, Sewage districts, *Sewage.
Identifiers: Sewage rates.

Penalties for late payment of sewer service bills and discounts for early payments of these bills are treated. The argument is that both should be eliminated; the penalty because it denotes an overbearing attitude, and the discount because it evokes thoughts of a bargain basement. Enhancement of a city's 'corporate image' is achieved by eliminating penalties and discounts. (Crabtree-Fla)
W69-02069

STORM SEWAGE SEPARATION BY HELICAL MOTION,
C. H. Dobbie, and J. W. Wielogorski.
Survr Munic Cty Engr, Vol 127, No 3839, pp 141-159, 1963.

Descriptors: *Storm runoff, *Overflow, Weirs, *Model studies.

An improved storm-sewage overflow is proposed, incorporating bends in the channel which produce helical flow, separating heavier materials and allowing the less-polluting liquid to flow over a weir along the outer wall of the channel. Tests are being conducted on a hydraulic model, which is illustrated, and it is hoped to incorporate this type of overflow in an existing sewerage system soon.

WASTE TREATMENT PLANT MODIFIED FOR INCREASED SOLIDS LOADING,
A. J. Reisdorph.
Pub Works, Vol 96, No 4, pp 113-114, 1965.

Descriptors: *Storm runoff, *Overflow, Discharge (Water), Sewage treatment.
Identifiers: *Combined sewers, Spokane (Wash).

The primary sewage-treatment plant at Spokane, Wash., has been enlarged to provide adequate treatment for the recently-added load of industrial waste waters (mainly from packing houses). The additional equipment includes a preliminary aeration unit for grease removal, and increased clarifying and digesting capacity. A storm-water overflow device selects the upper and lower strata in the combined sewers, containing comparatively clean water and grit respectively, for discharge direct to the Spokane river.

THE TREATMENT OF STORM SEWAGE,
B. D. Steele.
Symposium on Storm Sewage Overflows, May 4, 1967. Sponsored by the Institution of Civil Engineers.

Descriptors: *Water pollution, *Storm runoff, *Overflow, *Automatic control, Sewage treatment.
Identifiers: *Storage tanks.

A prime objective of the virtual resewerage of an area of about 27,900 acres at Coventry is the elimination of pollution in the river system, which forms the headwaters of the River Avon. The solution lies in the building of Storm Balancing Stations. In time of rain all flows in excess of 3 d.w.f. are spilled off into mechanically scraped circular tanks. Sludge is evacuated to the sewer. The provision of additional tanks or other processes is feasible. The tanks are probably unique in that overflow to the tanks, operation of the scraping mechanism, continuous pumping of sludge, sampling, tank emptying to the sewer and rising main emptying are all automatic. Results are beginning to become available from one station. Conclusions are that if in the future a proportion of the flow in a foul sewer may be discharged directly to the river the device for separating the elements must be designed on a more scientific basis, and the solution may lie in the provision of storm balancing tanks.

STORM WATER AND COMBINED SEWAGE OVERFLOWS,
S. A. Greeley, and P. E. Langdon.
ASCE Proc, J Sanit Eng Div, Vol 87, No SA1, 1961.

Descriptors: *Storm runoff, *Overflow, *Water pollution, Storms, Sewers, *Biochemical oxygen demand, Sewage treatment, *Chlorination, *Pathogenic bacteria.
Identifiers: *Combined sewers.

Most of the larger and older cities in the U. S. A. are served by combined sewerage systems resulting in pollution of waterways through overflows during storms. Such pollution could be removed by complete separation of storm water and sanitary sewage by the construction of a new system of sanitary sewers, but this would be expensive and inconvenient and is therefore of limited application. The interception and treatment of the dry weather flow and the first flushings of storm water will reduce the volume of sewage discharged through overflows to about 3 per cent of the total sewage flow, and with complete treatment of the intercepted flow about 90 per cent of the BOD can be removed. Treatment of intermittent discharges from overflows by retention and chlorination to remove floating solids and bacterial contamination can also improve conditions in receiving streams at reasonable cost.

SEPARATE SYSTEMS-COMBINED SYSTEMS,
E. Kuntze.
Abwass Technik, Vol 17, No 1, pp 8-10, 1966.

Descriptors: *Sewers, Sewage treatment, Water pollution, *Storm runoff, *Overflow, Pumping, Groundwater, Velocity.
Identifiers: *Combined sewers.

The author discusses, on the basis of experience, the advantages, disadvantages and economics of existing sewerage systems and compares the efficiency of the separate system with the combined system. Taking into account the requirements for sewage treatment and prevention of pollution of streams, detailed information is given on how risk of pollution by storm-sewage overflows and rain water pumps can be avoided. Taking into consideration the availability of existing sewerage systems, receiving waters, and local conditions, the author suggests that it must be decided individually whether the separate or the combined system is preferable. Where a new sewerage system is to be installed and good ground-water conditions prevail, the combined system was found to be more economical and adaptable; however, where the velocity of flow is low and a higher water level is required, the separate system is preferable especially when mineral substances can be washed away by the storm-sewage system.
